ATP1A2. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM2505 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32513, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84751] Another function of VGAM2505 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Basigin (OK blood group) (BSG, Accession XM_042018) is another VGAM2505 host target gene. BSG BINDING SITE1 and BSG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BSG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSG BINDING

SITE1 and BSG BINDING SITE2, designated SEQ ID:33668 and SEQ ID:7457 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84752] Another function of VGAM2505 is therefore inhibition of Basigin (OK blood group) (BSG, Accession XM_042018), a gene which is a LEUKOCYTE ACTIVATION ANTIGEN and a member of the immunoglobulin superfamily. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSG. The function of BSG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM958.Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030) is another VGAM2505 host target gene. CACNA2D2 BINDING SITE1 through CACNA2D2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CACNA2D2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D2 BINDING SITE1 through CACNA2D2 BINDING

SITE3, designated SEQ ID:12652, SEQ ID:12649 and SEQ ID:12650 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84753] Another function of VGAM2505 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030), a gene which is a calcium channel protein which plays an important role in excitation-contraction coupling. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA2D2. The function of CACNA2D2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM203.Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795) is another VGAM2505 host target gene. CDH5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE, designated SEQ ID:7546,

to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84754] Another function of VGAM2505 is therefore inhibition of Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795), a gene which associates with alpha-catenin forming a link to the cytoskeleton. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH5. The function of CDH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1342.CCAAT/enhancer Binding Protein (C/EBP), Alpha (CEBPA, Accession NM_004364) is another VGAM2505 host target gene. CEBPA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEBPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEBPA BINDING SITE, designated SEQ ID:10572, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84755] Another function of VGAM2505 is therefore inhibition of CCAAT/enhancer Binding Protein (C/EBP), Alpha (CEBPA, Accession NM_004364). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEBPA. C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 12 (CLECSF12, Accession XM_084768) is another VGAM2505 host target gene. CLECSF12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLECSF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:37684, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84756] Another function of VGAM2505 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 12 (CLECSF12, Accession XM_084768), a gene which is a pattern-recognition receptor . Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with CLECSF12. The function of CLECSF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM121.Collagen, Type V, Alpha 3 (COL5A3, Accession NM_015719) is another VGAM2505 host target gene. COL5A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL5A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL5A3 BINDING SITE, designated SEQ ID:17933, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84757] Another function of VGAM2505 is therefore inhibition of Collagen, Type V, Alpha 3 (COL5A3, Accession NM_015719). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL5A3. Casein Kinase 2, Alpha Prime Polypeptide (CSNK2A2, Accession NM_001896) is another VGAM2505 host target gene. CSNK2A2 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by CSNK2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK2A2 BINDING SITE, designated SEQ ID:7623, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84758] Another function of VGAM2505 is therefore inhibition of Casein Kinase 2, Alpha Prime Polypeptide (CSNK2A2, Accession NM_001896), a gene which catalyzes the phosphorylation of serine or threonine residues in proteins. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A2. The function of CSNK2A2 has been established by previous studies. Phosphorylation of the human p53 protein (OMIM Ref. No. 191170) at ser392 is responsive to ultraviolet (UV) but not gamma irradiation. Keller et al. (2001) identified and purified a mammalian UV-activated protein kinase complex that phosphorylates ser392 in vitro. This kinase complex contains CK2 and the chromatin transcriptional elongation factor FACT, a heterodimer of SPT16 (OMIM Ref. No.

605012) and SSRP1 (OMIM Ref. No. 604328). In vitro studies showed that FACT alters the specificity of CK2 in the complex such that it selectively phosphorylates p53 over other substrates, including casein. In addition, phosphorylation by the kinase complex was found to enhance p53 activity. These results provided a potential mechanism for p53 activation by UV irradiation Doray et al. (2002) demonstrated that the Golgi-localized, gamma-ear-containing adenosine diphosphate ribosylation factor-binding proteins (GGA1, 606004 and GGA3, 606006) and the coat protein adaptor protein-1 (AP-1) complex (see OMIM Ref. No. AP1G2, 603534) colocalize in clathrin-coated buds of the trans-Golgi networks of mouse L cells and human HeLa cells. Binding studies revealed a direct interaction between the hinge domains of the GGAs and the gamma-ear domain of AP-1. Further, AP-1 contained bound casein kinase-2 that phosphorylated GGA1 and GGA3, thereby causing autoinhibition. Doray et al. (2002) demonstrated that this autoinhibition could induce the directed transfer of mannose 6-phosphate receptors (see OMIM Ref. No. 154540) from the GGAs to AP-1. Mannose 6-phosphate receptors that were defective in binding to GGAs were poorly incorporated into adaptor protein com-

plex containing clathrin coated vesicles. Thus, Doray et al. (2002) concluded that GGAs and the AP-1 complex interact to package mannose 6-phosphate receptors into AP-1-containing coated vesicles Animal model experiments lend further support to the function of CSNK2A2. To determine the functional and developmental role of protein kinase casein kinase II, Xu et al. (1999) used homologous recombination to disrupt the gene encoding Csnk2a2 in transgenic mice. They found that Csnk2a2 is preferentially expressed in late stages of spermatogenesis, and male mice in which Csnk2a2 has been disrupted are infertile, with oligospermia and globozoospermia ('round-headed spermatozoa'). This was the first demonstration of the unique role for a Ck2 isoform in development. The primary spermatogenic defect in the Csnk2a2 -/- testis is a specific abnormality of anterior head shaping of elongating spermatids; this is the first defined gene that regulates sperm head morphogenesis. As the germ cells differentiate, they are capable of undergoing chromatin condensation, although many abnormal cells are deleted through apoptosis or Sertoli cell phagocytosis. The few that survived to populate the epididymis exhibited head abnormalities similar to those described in human globo-

zoospermia; thus, Csnk2a2 may be a candidate gene for inherited abnormalities of sperm morphogenesis

[84759] It is appreciated that the abovementioned animal model for CSNK2A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[84760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84761] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP-1 in packaging MPRs at the trans-Golgi network. Science 297: 1700-1703, 2002. ; and

[84762] Xu, X.; Toselli, P. A.; Russell, L. D.; Seldin, D. C. : Globozoospermia in mice lacking the casein kinase II alpha-prime catalytic subunit. Nature Genet. 23: 118-121, 1999.

[84763] Further studies establishing the function and utilities of CSNK2A2 are found in John Hopkins OMIM database record ID 115442, and in sited publications numbered 12596, 12601-12602, 87 and 12600 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Acces-

sion NM_000767) is another VGAM2505 host target gene. CYP2B6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP2B6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE, designated SEQ ID:6416, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84764] Another function of VGAM2505 is therefore inhibition of Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Accession NM_000767), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2B6. The function of CYP2B6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336) is another VGAM2505 host target gene.

DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, designated SEQ ID:14265 and SEQ ID:14272 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84765] Another function of VGAM2505 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. Dystonia 1, Torsion (autosomal dominant; torsin A) (DYT1, Accession NM_000113) is another VGAM2505 host target gene. DYT1 BINDING SITE1 and DYT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYT1 BINDING SITE1 and

DYT1 BINDING SITE2, designated SEQ ID:5578 and SEQ ID:5579 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84766] Another function of VGAM2505 is therefore inhibition of Dystonia 1, Torsion (autosomal dominant; torsin A) (DYT1, Accession NM_000113). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYT1. ELK1, Member of ETS Oncogene Family (ELK1, Accession NM_005229) is another VGAM2505 host target gene. ELK1 BINDING SITE1 and ELK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ELK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK1 BINDING SITE1 and ELK1 BINDING SITE2, designated SEQ ID:11730 and SEQ ID:11731 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84767] Another function of VGAM2505 is therefore inhibition of ELK1, Member of ETS Oncogene Family (ELK1, Accession

NM_005229), a gene which stimulates transcription. can form a ternary complex with the serum response factor and the ets and srf motifs of the fos serum response element. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELK1. The function of ELK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549) is another VGAM2505 host target gene. FEZ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:22876, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84768] Another function of VGAM2505 is therefore inhibition of Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans

UNC-76. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1. The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_023109) is another VGAM2505 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3, designated SEQ ID:23369, SEQ ID:17975 and SEQ ID:6204 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84769] Another function of VGAM2505 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_023109). Accordingly, utilities of VGAM2505 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530) is another VGAM2505 host target gene. HIF1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7265, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84770] Another function of VGAM2505 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF1A. The function of HIF1A and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM229.High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM2505 host target gene. HMGA2 BINDING SITE1 through HMGA2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HMGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE1 through HMGA2 BINDING SITE3, designated SEQ ID:9562, SEQ ID:9564 and SEQ ID:9565 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84771] Another function of VGAM2505 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM552.Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254) is another VGAM2505 host target gene. HS3ST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS3ST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST4 BINDING SITE, designated SEQ ID:36370, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84772] Another function of VGAM2505 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST4. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586) is another VGAM2505 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15953, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84773] Another function of VGAM2505 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464) is another VGAM2505 host target gene. HYOU1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYOU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYOU1 BINDING SITE, designated SEQ ID:30001, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84774] Another function of VGAM2505 is therefore inhibition of Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464). Accordingly, utilities of VGAM2505 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with HYOU1. Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM_012282) is another VGAM2505 host target gene. KCNE1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNE1L BINDING SITE, designated SEQ ID:14613, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84775] Another function of VGAM2505 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM_012282), a gene which is a potassium voltage-gated channel. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE1L. The function of KCNE1L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.Lymphocyte-activation Gene

3 (LAG3, Accession NM_002286) is another VGAM2505 host target gene. LAG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAG3 BINDING SITE, designated SEQ ID:8066, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84776] Another function of VGAM2505 is therefore inhibition of Lymphocyte-activation Gene 3 (LAG3, Accession NM_002286), a gene which is involved in lymphocyte activation. binds to hla class-ii antigens. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAG3. The function of LAG3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2353.LFG (Accession XM_084780) is another VGAM2505 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37692, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84777] Another function of VGAM2505 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332) is another VGAM2505 host target gene. LRP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1 BINDING SITE, designated SEQ ID:8136, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84778] Another function of VGAM2505 is therefore inhibition of Low Density Lipoprotein-related Protein 1

(alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332), a gene which is a recycling lipoprotein receptor with possible growth-modulating effects. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1. The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239) is another VGAM2505 host target gene. LYZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYZ BINDING SITE, designated SEQ ID:5757, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84779] Another function of VGAM2505 is therefore inhibition of Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239), a gene which a bacteriolytic enzyme. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with LYZ. The function of LYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM929.Mediterranean Fever (MEFV, Accession NM_000243) is another VGAM2505 host target gene. MEFV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEFV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:5768, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84780] Another function of VGAM2505 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM_000243). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM_002428) is another VGAM2505 host target gene. MMP15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP15, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP15 BINDING SITE, designated SEQ ID:8264, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84781] Another function of VGAM2505 is therefore inhibition of Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM_002428). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP15. Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM_005373) is another VGAM2505 host target gene. MPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE, designated SEQ ID:11849, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84782] Another function of VGAM2505 is therefore inhibition of

Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM_005373). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPL. Membrane Protein, Palmitoylated 3 (MAGUK p55 subfamily member 3) (MPP3, Accession NM_001932) is another VGAM2505 host target gene. MPP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP3 BINDING SITE, designated SEQ ID:7642, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84783] Another function of VGAM2505 is therefore inhibition of Membrane Protein, Palmitoylated 3 (MAGUK p55 subfamily member 3) (MPP3, Accession NM_001932). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP3. Nipsnap Homolog 1 (C. elegans) (NIPSNAP1, Accession NM_003634) is another VGAM2505 host target gene. NIPSNAP1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by NIPSNAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:9702, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84784] Another function of VGAM2505 is therefore inhibition of Nipsnap Homolog 1 (C. elegans) (NIPSNAP1, Accession NM_003634). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1. Notch Homolog 3 (Drosophila) (NOTCH3, Accession NM_000435) is another VGAM2505 host target gene. NOTCH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOTCH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOTCH3 BINDING SITE, designated SEQ ID:6017, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84785] Another function of VGAM2505 is therefore inhibition of Notch Homolog 3 (Drosophila) (NOTCH3, Accession NM_000435), a gene which may function in cell fate specification during development. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH3. The function of NOTCH3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.Protocadherin Beta 11 (PCDHB11, Accession NM_018931) is another VGAM2505 host target gene. PCDHB11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHB11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB11 BINDING SITE, designated SEQ ID:21001, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84786] Another function of VGAM2505 is therefore inhibition of Protocadherin Beta 11 (PCDHB11, Accession NM_018931). Accordingly, utilities of VGAM2505 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHB11. Phosducin-like (PDCL, Accession NM_005388) is another VGAM2505 host target gene. PDCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:11865, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84787] Another function of VGAM2505 is therefore inhibition of Phosducin-like (PDCL, Accession NM_005388), a gene which may regulate G-protein signaling and similar to phosducins. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL. The function of PDCL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1708.Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283) is another

VGAM2505 host target gene. PDE6B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:5827, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84788] Another function of VGAM2505 is therefore inhibition of Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B. Plexin A1 (PLXNA1, Accession XM_051261) is another VGAM2505 host target gene. PLXNA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLXNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA1 BINDING SITE, designated SEQ ID:35791, to the

nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84789] Another function of VGAM2505 is therefore inhibition of Plexin A1 (PLXNA1, Accession XM_051261). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA1. Prostaglandin I2 (prostacyclin) Synthase (PTGIS, Accession NM_000961) is another VGAM2505 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6670, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84790] Another function of VGAM2505 is therefore inhibition of Prostaglandin I2 (prostacyclin) Synthase (PTGIS, Accession NM_000961), a gene which catalyzes the isomerization of prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PTGIS. The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM_002832) is another VGAM2505 host target gene. PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPN7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3, designated SEQ ID:8710, SEQ ID:27888 and SEQ ID:27891 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84791] Another function of VGAM2505 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM_002832). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN7. Retinoic Acid Receptor, Beta (RARB, Accession NM_016152) is another VGAM2505 host target gene.

RARB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RARB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARB BINDING SITE, designated SEQ ID:18237, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84792] Another function of VGAM2505 is therefore inhibition of Retinoic Acid Receptor, Beta (RARB, Accession NM_016152), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.Rabphilin 3A-like (without C2 domains) (RPH3AL, Accession NM_006987) is another VGAM2505 host target gene. RPH3AL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPH3AL, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3AL BINDING SITE, designated SEQ ID:13848, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84793] Another function of VGAM2505 is therefore inhibition of Rabphilin 3A-like (without C2 domains) (RPH3AL, Accession NM_006987), a gene which is a protein transporter. could play a role in neurotransmitter release by regulating membrane flow in the nerve terminal. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3AL. The function of RPH3AL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM2505 host target gene. SEDL BINDING SITE1 and SEDL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of SEDL BINDING SITE1 and SEDL BINDING SITE2, designated SEQ ID:15907 and SEQ ID:15908 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84794] Another function of VGAM2505 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM2505 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14008, to the

nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84795] Another function of VGAM2505 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Sorting Nexin 15 (SNX15, Accession XM_057307) is another VGAM2505 host target gene. SNX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:36504, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84796] Another function of VGAM2505 is therefore inhibition of Sorting Nexin 15 (SNX15, Accession XM_057307). Accord-

ingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15. Sp4 Transcription Factor (SP4, Accession NM_003112) is another VGAM2505 host target gene. SP4 BINDING SITE1 and SP4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP4 BINDING SITE1 and SP4 BINDING SITE2, designated SEQ ID:9082 and SEQ ID:9083 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84797] Another function of VGAM2505 is therefore inhibition of Sp4 Transcription Factor (SP4, Accession NM_003112), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP4. The function of SP4 has been established by previous studies. Hagen et al. (1992) performed recognition site screening for factors which bind to the uteroglobin promoter sequence GT box and cloned

cDNAs encoding the DNA-binding proteins SP3 (OMIM Ref. No. 601804) and SP4, thus revealing the existence of a multigene family of SP proteins. They found that SP1, SP3, and SP4 exhibit similar structural features: all contain DNA-binding domains composed of 3 zinc fingers of the Cys2/His2 type near the C terminus, and all recognize GC- and GT-box sequences. Additionally, the N termini of all 3 proteins are composed of long serine/threonine- and glutamine-rich regions that have been identified in SP1 as transactivation domains. Hagen et al. (1992) showed by Northern blot analysis that SP4 is abundantly expressed as a 7.5-kb message in brain, but barely detectable in other human cell lines. Hagen et al. (1995) used cotransfection experiments to show that SP4 is an activator protein like SP1. However, in contrast to SP1, they found that SP4 is not able to act synergistically through adjacent binding sites. Animal model experiments lend further support to the function of SP4. Gollner et al. (2001) found that Sp4 knockout mice, with a complete absence of Sp4 expression due to targeted deletion of the exons encoding the N-terminal activation domains, showed a complex phenotype. They developed until birth without obvious abnormalities. After birth, two-thirds died within 4 weeks. Sur-

viving mice were growth retarded. Males homozygous for the null mutation did not breed; the reason for this remained obscure since they showed complete spermatogenesis, and pheromone receptor genes in the vomeronasal organ appeared unaffected. Female null mice had a smaller thymus, spleen, and uterus and exhibited a pronounced delay in sexual maturation. Thus, the phenotype of the Sp4-null mice differed significantly from those described for the Sp1- and Sp3-null mice. The authors concluded that the structural similarities, the common recognition motif, and the overlapping expression pattern of these 3 transcription factors do not reflect similar physiologic functions.

[84798] It is appreciated that the abovementioned animal model for SP4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[84799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84800] Gollner, H.; Bouwman, P.; Mangold, M.; Karis, A.; Braun, H.; Rohner, I.; Del Rey, A.; Besedovsky, H.-O.; Meinhardt, A.; van den Broek, M.; Cutforth, T.; Grosveld, F.; Philipsen,

S.; Suske, G. : Complex phenotype of mice homozygous for a null mutation in the Sp4 transcription factor gene. Genes Cells 6: 689-697, 2001. ; and

[84801] Hagen, G.; Dennig, J.; Preiss, M.; Beato, M.; Suske, G. : Functional analyses of the transcription factor Sp4 reveal properties distinct from Sp1 and Sp3. J. Biol. Chem. 270: 24989-24994.

[84802] Further studies establishing the function and utilities of SP4 are found in John Hopkins OMIM database record ID 600540, and in sited publications numbered 7687-7691 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Tyrosine Aminotransferase (TAT, Accession NM_000353) is another VGAM2505 host target gene. TAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAT BINDING SITE, designated SEQ ID:5913, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84803] Another function of VGAM2505 is therefore inhibition of

Tyrosine Aminotransferase (TAT, Accession NM_000353), a gene which is tyrosine aminotransferase and strongly similar to rat Rn.9947, which plays a role in gluconeogenesis. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAT. The function of TAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2434.Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM2505 host target gene. TBXA2R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6725, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84804] Another function of VGAM2505 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca2+-activated chloride channels; stimulates platelet aggregation and

smooth muscle constriction. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM_003811) is another VGAM2505 host target gene. TNFSF9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF9 BINDING SITE, designated SEQ ID:9903, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84805] Another function of VGAM2505 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM_003811). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF9. Tensin (TNS, Accession NM_022648) is another

VGAM2505 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22900, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84806] Another function of VGAM2505 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. TZFP (Accession NM_014383) is another VGAM2505 host target gene. TZFP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TZFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TZFP BINDING SITE, designated SEQ ID:15719, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84807] Another function of VGAM2505 is therefore inhibition of TZFP (Accession NM_014383), a gene which is probably a transcription factor. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TZFP. The function of TZFP has been established by previous studies. Fanconi anemia (FA) is a genetically heterogeneous disorder composed of at least 8 different complementation groups identified by somatic cell hybrid analysis. However, because FA patients have similar clinical phenotypes (e.g., predisposition to cancer) and cellular phenotypes (hypersensitivity to DNA crosslinking agents), a common molecular pathway has been hypothesized. FANCC (OMIM Ref. No. 227645) has been detected in both the cytoplasm and nucleus and has been shown to interact with other cellular proteins, including FANCA (OMIM Ref. No. 227650). Using a yeast 2-hybrid screen of a B-cell cDNA library with N-terminal sequences of FANCC as bait, and by confirming the interactions using GST pull-down assays, followed by RT-PCR, Hoatlin et al. (1999) isolated a cDNA encoding FAZF. Sequence analysis predicted that the 487-amino acid protein, which is similar to PLZF (OMIM Ref. No. 176797), contains an N-terminal POZ/BTB

domain and 3 zinc fingers. Northern blot analysis detected weak expression of a 1.4-kb transcript in most tissues tested except peripheral blood leukocytes, where strong expression was detected, and testis, where strong expression of 2.0-, 2.7-, and 4.4-kb transcripts was detected. Coimmunoprecipitation analysis showed that FAZF associates with FANCC independent of the BTB/POZ domain. Indirect immunofluorescence and confocal microscopy demonstrated almost entirely nuclear expression for FAZF and colocalization with FANCC, which Hoatlin et al. (1999) confirmed is also expressed in cytoplasm in some cells; FANCC and PLZF did not colocalize. EMSA analysis suggested that PLZF and FAZF bind to CpG islands, interact with each other through the POZ domain of PLZF, and repress transcription by a similar mechanism. By database searching, genomic analysis, RT-PCR, and yeast 2-hybrid screening, Lin et al. (1999) cloned FAZF, which they termed TZFP. Genomic sequence analysis determined that the TZFP gene contains 5 exons. Northern blot analysis detected expression of 3 transcripts only in testis.

[84808] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[84809] Hoatlin, M. E.; Zhi, Y.; Ball, H.; Silvery, K.; Melnick, A.; Stone, S.; Arai, S.; Hawe, N.; Owen, G.; Zelent, A.; Licht, J. D. : A novel BTB/POZ transcriptional repressor protein interacts with the Fanconi anemia group C protein and PLZF. Blood 94: 3737-3747, 1999. ; and

[84810] Lin, W.; Lai, C.-H.; Tang, C.-J. C.; Huang, C.-J.; Tang, T. K. : Identification and gene structure of a novel human PLZF-related transcription factor gene, TZFP. Biochem. Biophys. Res. Com.

[84811] Further studies establishing the function and utilities of TZFP are found in John Hopkins OMIM database record ID 605859, and in sited publications numbered 6782-6783 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Zinc Finger Protein 133 (clone pHZ-13) (ZNF133, Accession NM_003434) is another VGAM2505 host target gene. ZNF133 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF133 BINDING SITE, designated SEQ ID:9486, to the nu-

cleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84812] Another function of VGAM2505 is therefore inhibition of Zinc Finger Protein 133 (clone pHZ-13) (ZNF133, Accession NM_003434). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF133. Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422) is another VGAM2505 host target gene. ZNF42 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF42 BINDING SITE, designated SEQ ID:9469, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84813] Another function of VGAM2505 is therefore inhibition of Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422), a gene which may be one regulator of transcriptional events during hemopoietic development. Accordingly, utilities of

VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF42. The function of ZNF42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_006411) is another VGAM2505 host target gene. AGPAT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AGPAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:13115, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84814] Another function of VGAM2505 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_006411). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AG-

PAT1. Adenylate Kinase 5 (AK5, Accession NM_012093) is another VGAM2505 host target gene. AK5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AK5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK5 BINDING SITE, designated SEQ ID:14393, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84815] Another function of VGAM2505 is therefore inhibition of Adenylate Kinase 5 (AK5, Accession NM_012093). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK5. APCL (Accession NM_005883) is another VGAM2505 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12498, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5216.

[84816] Another function of VGAM2505 is therefore inhibition of APCL (Accession NM_005883). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082) is another VGAM2505 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37816, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84817] Another function of VGAM2505 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. ATPase, (Na+)/K+ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM2505 host target

gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14323, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84818] Another function of VGAM2505 is therefore inhibition of ATPase, (Na+)/K+ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. BA108L7.2 (Accession NM_030971) is another VGAM2505 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25239, to the nucleotide sequence of VGAM2505 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5216.

[84819] Another function of VGAM2505 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. BCL2-associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM2505 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11302, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84820] Another function of VGAM2505 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. BMF (Accession NM_033503) is another VGAM2505 host target gene. BMF BINDING SITE1 and BMF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by BMF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE1 and BMF BINDING SITE2, designated SEQ ID:27276 and SEQ ID:27280 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84821] Another function of VGAM2505 is therefore inhibition of BMF (Accession NM_033503). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956) is another VGAM2505 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21026, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84822] Another function of VGAM2505 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. Centaurin, Alpha 1 (CENTA1, Accession NM_006869) is another VGAM2505 host target gene. CENTA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTA1 BINDING SITE, designated SEQ ID:13739, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84823] Another function of VGAM2505 is therefore inhibition of Centaurin, Alpha 1 (CENTA1, Accession NM_006869). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA1. Claudin 6 (CLDN6, Accession NM_021195) is another VGAM2505 host target gene. CLDN6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CLDN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN6 BINDING SITE, designated SEQ ID:22171, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84824] Another function of VGAM2505 is therefore inhibition of Claudin 6 (CLDN6, Accession NM_021195). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN6. Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM_013434) is another VGAM2505 host target gene. CSEN BINDING SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by CSEN, correspond-ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSEN BINDING SITE, designated SEQ ID:15087, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84825] Another function of VGAM2505 is therefore inhibition of

Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM_013434). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSEN. Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646) is another VGAM2505 host target gene. DGKZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKZ BINDING SITE, designated SEQ ID:9721, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84826] Another function of VGAM2505 is therefore inhibition of Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKZ. DKFZp434A2417 (Accession XM_038526) is another VGAM2505 host target gene. DKFZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32860, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84827] Another function of VGAM2505 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. DKFZP434C212 (Accession XM_044196) is another VGAM2505 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:34168, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84828] Another function of VGAM2505 is therefore inhibition of DKFZP434C212 (Accession XM_044196). Accordingly,

utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. DKFZp434J0226 (Accession XM_051327) is another VGAM2505 host target gene. DKFZp434J0226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434J0226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J0226 BINDING SITE, designated SEQ ID:35805, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84829] Another function of VGAM2505 is therefore inhibition of DKFZp434J0226 (Accession XM_051327). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J0226. DKFZP434L187 (Accession XM_044070) is another VGAM2505 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34123, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84830] Another function of VGAM2505 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. DKFZp547H025 (Accession NM_020161) is another VGAM2505 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21369, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84831] Another function of VGAM2505 is therefore inhibition of DKFZp547H025 (Accession NM_020161). Accordingly, utilities of VGAM2505 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547H025. DKFZP564O0523 (Accession NM_032120) is another VGAM2505 host target gene. DKFZP564O0523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0523 BINDING SITE, designated SEQ ID:25804, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84832] Another function of VGAM2505 is therefore inhibition of DKFZP564O0523 (Accession NM_032120). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0523. Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569) is another VGAM2505 host target gene. DMWD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of DMWD BINDING SITE, designated SEQ ID:30531, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84833] Another function of VGAM2505 is therefore inhibition of Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMWD. FBP17 (Accession XM_052666) is another VGAM2505 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36048, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84834] Another function of VGAM2505 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17.

FLJ00007 (Accession XM_048928) is another VGAM2505 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35313, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84835] Another function of VGAM2505 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ10748 (Accession NM_018203) is another VGAM2505 host target gene. FLJ10748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10748 BINDING SITE, designated SEQ ID:20085, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM

RNA, also designated SEQ ID:5216.

[84836] Another function of VGAM2505 is therefore inhibition of FLJ10748 (Accession NM_018203). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10748. FLJ12363 (Accession NM_032167) is another VGAM2505 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:25866, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84837] Another function of VGAM2505 is therefore inhibition of FLJ12363 (Accession NM_032167). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ12529 (Accession NM_024811) is another VGAM2505 host target gene. FLJ12529 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12529, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12529 BINDING SITE, designated SEQ ID:24191, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84838] Another function of VGAM2505 is therefore inhibition of FLJ12529 (Accession NM_024811). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12529. FLJ12903 (Accession NM_022753) is another VGAM2505 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22978, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84839] Another function of VGAM2505 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12903. FLJ12973 (Accession NM_024908) is another VGAM2505 host target gene. FLJ12973 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:24406, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84840] Another function of VGAM2505 is therefore inhibition of FLJ12973 (Accession NM_024908). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973. FLJ14950 (Accession NM_032865) is another VGAM2505 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26672, to the nucleotide

sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84841] Another function of VGAM2505 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ20079 (Accession NM_017656) is another VGAM2505 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19176, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84842] Another function of VGAM2505 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20113 (Accession NM_017670) is another VGAM2505 host target gene. FLJ20113 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ20113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20113 BINDING SITE, designated SEQ ID:19211, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84843] Another function of VGAM2505 is therefore inhibition of FLJ20113 (Accession NM_017670). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20113. FLJ21709 (Accession XM_085480) is another VGAM2505 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38167, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84844] Another function of VGAM2505 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of

VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. FLJ22002 (Accession NM_024838) is another VGAM2505 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24245, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84845] Another function of VGAM2505 is therefore inhibition of FLJ22002 (Accession NM_024838). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22002. FLJ22531 (Accession NM_024650) is another VGAM2505 host target gene. FLJ22531 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22531

BINDING SITE, designated SEQ ID:23944, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84846] Another function of VGAM2505 is therefore inhibition of FLJ22531 (Accession NM_024650). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531. FLJ22794 (Accession XM_166220) is another VGAM2505 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44023, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84847] Another function of VGAM2505 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. GMPPB (Accession XM_171044) is another VGAM2505 host target gene. GMPPB BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45812, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84848] Another function of VGAM2505 is therefore inhibition of GMPPB (Accession XM_171044). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. H-plk (Accession NM_015852) is another VGAM2505 host target gene. H-plk BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:17984, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84849] Another function of VGAM2505 is therefore inhibition of

H-plk (Accession NM_015852). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk. ICK (Accession NM_014920) is another VGAM2505 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17195, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84850] Another function of VGAM2505 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. KIAA0063 (Accession NM_014876) is another VGAM2505 host target gene. KIAA0063 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE,

designated SEQ ID:17016, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84851] Another function of VGAM2505 is therefore inhibition of KIAA0063 (Accession NM_014876). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063. KIAA0429 (Accession NM_014751) is another VGAM2505 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16471, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84852] Another function of VGAM2505 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA0450 (Accession NM_014638) is another VGAM2505 host target gene. KIAA0450 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16028, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84853] Another function of VGAM2505 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0459 (Accession XM_027862) is another VGAM2505 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30574, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84854] Another function of VGAM2505 is therefore inhibition of

KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0513 (Accession NM_014732) is another VGAM2505 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16354, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84855] Another function of VGAM2505 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0532 (Accession XM_047659) is another VGAM2505 host target gene. KIAA0532 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:35024, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84856] Another function of VGAM2505 is therefore inhibition of KIAA0532 (Accession XM_047659). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532. KIAA0557 (Accession XM_085507) is another VGAM2505 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38211, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84857] Another function of VGAM2505 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0562 (Accession NM_014704) is another

VGAM2505 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16242, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84858] Another function of VGAM2505 is therefore inhibition of KIAA0562 (Accession NM_014704). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. KIAA0841 (Accession XM_049237) is another VGAM2505 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35362, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84859] Another function of VGAM2505 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA1196 (Accession XM_028968) is another VGAM2505 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30816, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84860] Another function of VGAM2505 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. KIAA1198 (Accession XM_032674) is another VGAM2505 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31706, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84861] Another function of VGAM2505 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1257 (Accession XM_031577) is another VGAM2505 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31431, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84862] Another function of VGAM2505 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1257. KIAA1373 (Accession XM_048195) is another VGAM2505 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35126, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84863] Another function of VGAM2505 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. KIAA1416 (Accession XM_098762) is another VGAM2505 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41802, to the nucleotide sequence of VGAM2505 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5216.

[84864] Another function of VGAM2505 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1554 (Accession XM_170834) is another VGAM2505 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45614, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84865] Another function of VGAM2505 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. KIAA1571 (Accession XM_027744) is another VGAM2505 host target gene. KIAA1571 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1571, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:30565, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84866] Another function of VGAM2505 is therefore inhibition of KIAA1571 (Accession XM_027744). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571. KIAA1610 (Accession XM_040622) is another VGAM2505 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33338, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84867] Another function of VGAM2505 is therefore inhibition of KIAA1610 (Accession XM_040622). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1610. KIAA1615 (Accession XM_044021) is another VGAM2505 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34083, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84868] Another function of VGAM2505 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. KIAA1719 (Accession XM_042936) is another VGAM2505 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33821, to the

nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84869] Another function of VGAM2505 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1904 (Accession XM_056282) is another VGAM2505 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36375, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84870] Another function of VGAM2505 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1910 (Accession XM_055514) is another VGAM2505 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36286, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84871] Another function of VGAM2505 is therefore inhibition of KIAA1910 (Accession XM_055514). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. KIAA1938 (Accession XM_166407) is another VGAM2505 host target gene. KIAA1938 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1938 BINDING SITE, designated SEQ ID:44277, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84872] Another function of VGAM2505 is therefore inhibition of KIAA1938 (Accession XM_166407). Accordingly, utilities

of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1938. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316) is another VGAM2505 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14687, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84873] Another function of VGAM2505 is therefore inhibition of Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6. MCLC (Accession NM_015127) is another VGAM2505 host target gene. MCLC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MCLC BINDING SITE, designated SEQ ID:17490, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84874] Another function of VGAM2505 is therefore inhibition of MCLC (Accession NM_015127). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCLC. Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 3 (mouse) (MEIS3, Accession XM_085721) is another VGAM2505 host target gene. MEIS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS3 BINDING SITE, designated SEQ ID:38311, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84875] Another function of VGAM2505 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 3 (mouse) (MEIS3, Accession XM_085721). Accordingly, utilities of VGAM2505 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with MEIS3. MGC10924 (Accession NM_030571) is another VGAM2505 host target gene. MGC10924 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10924 BINDING SITE, designated SEQ ID:24945, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84876] Another function of VGAM2505 is therefore inhibition of MGC10924 (Accession NM_030571). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10924. MGC14376 (Accession NM_032895) is another VGAM2505 host target gene. MGC14376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14376 BINDING SITE, designated SEQ ID:26722, to

the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84877] Another function of VGAM2505 is therefore inhibition of MGC14376 (Accession NM_032895). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14376. MGC15730 (Accession NM_032880) is another VGAM2505 host target gene. MGC15730 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC15730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15730 BINDING SITE, designated SEQ ID:26700, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84878] Another function of VGAM2505 is therefore inhibition of MGC15730 (Accession NM_032880). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15730. MGC16703 (Accession XM_054591) is another VGAM2505 host target gene. MGC16703 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by MGC16703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16703 BINDING SITE, designated SEQ ID:36179, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84879] Another function of VGAM2505 is therefore inhibition of MGC16703 (Accession XM_054591). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16703. MGC2474 (Accession NM_023931) is another VGAM2505 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23414, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84880] Another function of VGAM2505 is therefore inhibition of MGC2474 (Accession NM_023931). Accordingly, utilities

of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. MGC9912 (Accession NM_080664) is another VGAM2505 host target gene. MGC9912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC9912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9912 BINDING SITE, designated SEQ ID:27951, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84881] Another function of VGAM2505 is therefore inhibition of MGC9912 (Accession NM_080664). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9912. NADH Dehydrogenase (ubiquinone) 1, Subcomplex Unknown, 2, 14.5kDa (NDUFC2, Accession NM_004549) is another VGAM2505 host target gene. NDUFC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDUFC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NDUFC2 BINDING SITE, designated SEQ ID:10894, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84882] Another function of VGAM2505 is therefore inhibition of NADH Dehydrogenase (ubiquinone) 1, Subcomplex Unknown, 2, 14.5kDa (NDUFC2, Accession NM_004549). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFC2. Nup43 (Accession NM_024647) is another VGAM2505 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23934, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84883] Another function of VGAM2505 is therefore inhibition of Nup43 (Accession NM_024647). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with Nup43. OBTP (Accession NM_017601) is another VGAM2505 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19079, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84884] Another function of VGAM2505 is therefore inhibition of OBTP (Accession NM_017601). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498) is another VGAM2505 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1

and OSBPL2 BINDING SITE2, designated SEQ ID:29318 and SEQ ID:16850 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84885] Another function of VGAM2505 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. Platelet Derived Growth Factor C (PDGFC, Accession NM_016205) is another VGAM2505 host target gene. PDGFC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDGFC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFC BINDING SITE, designated SEQ ID:18302, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84886] Another function of VGAM2505 is therefore inhibition of Platelet Derived Growth Factor C (PDGFC, Accession NM_016205). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PDGFC. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM_047620) is another VGAM2505 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35016, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84887] Another function of VGAM2505 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM_047620). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM2505 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34877, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84888] Another function of VGAM2505 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. PP3501 (Accession NM_021731) is another VGAM2505 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22331, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84889] Another function of VGAM2505 is therefore inhibition of PP3501 (Accession NM_021731). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PP3501. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2505 host target gene. PPP1R16B BINDING SITE1 and PPP1R16B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R16B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE1 and PPP1R16B BINDING SITE2, designated SEQ ID:30773 and SEQ ID:30769 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84890] Another function of VGAM2505 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. RASD Family, Member 2 (RASD2, Accession NM_014310) is another VGAM2505 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15600, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84891] Another function of VGAM2505 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM_014310). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM2505 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10095, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84892] Another function of VGAM2505 is therefore inhibition of

Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. SCAMP5 (Accession NM_138967) is another VGAM2505 host target gene. SCAMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:29074, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84893] Another function of VGAM2505 is therefore inhibition of SCAMP5 (Accession NM_138967). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession NM_017893) is another VGAM2505 host target gene. SEMA4G BINDING SITE1 and SEMA4G BINDING SITE2 are HOST TARGET bind-

ing sites found in untranslated regions of mRNA encoded by SEMA4G, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE1 and SEMA4G BINDING SITE2, designated SEQ ID:19564 and SEQ ID:45413 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84894] Another function of VGAM2505 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession NM_017893). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. Trinucleotide Repeat Containing 4 (TNRC4, Accession NM_007185) is another VGAM2505 host target gene. TNRC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC4 BINDING SITE, des-

ignated SEQ ID:14040, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84895] Another function of VGAM2505 is therefore inhibition of Trinucleotide Repeat Containing 4 (TNRC4, Accession NM_007185). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC4. Tubby Homolog (mouse) (TUB, Accession NM_003320) is another VGAM2505 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9323, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84896] Another function of VGAM2505 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM_003320). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUB. Ubiquitin Specific Protease 22

(USP22, Accession XM_042698) is another VGAM2505 host target gene. USP22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:33751, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84897] Another function of VGAM2505 is therefore inhibition of Ubiquitin Specific Protease 22 (USP22, Accession XM_042698). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22. Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM_022916) is another VGAM2505 host target gene. VPS33A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:23231, to the

nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84898] Another function of VGAM2505 is therefore inhibition of Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM_022916). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS33A. Williams-Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042) is another VGAM2505 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24637, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84899] Another function of VGAM2505 is therefore inhibition of Williams-Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

WBSCR23. LOC112724 (Accession NM_138412) is another VGAM2505 host target gene. LOC112724 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC112724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112724 BINDING SITE, designated SEQ ID:28777, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84900] Another function of VGAM2505 is therefore inhibition of LOC112724 (Accession NM_138412). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112724. LOC115399 (Accession XM_055874) is another VGAM2505 host target gene. LOC115399 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115399 BINDING SITE, designated SEQ ID:36346, to the nucleotide sequence of VGAM2505 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5216.

[84901] Another function of VGAM2505 is therefore inhibition of LOC115399 (Accession XM_055874). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115399. LOC116113 (Accession XM_166413) is another VGAM2505 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44284, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84902] Another function of VGAM2505 is therefore inhibition of LOC116113 (Accession XM_166413). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC116411 (Accession XM_058095) is another VGAM2505 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC116411, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36568, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84903] Another function of VGAM2505 is therefore inhibition of LOC116411 (Accession XM_058095). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC124976 (Accession XM_058879) is another VGAM2505 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE, designated SEQ ID:36783, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84904] Another function of VGAM2505 is therefore inhibition of LOC124976 (Accession XM_058879). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC124976. LOC130813 (Accession XM_065904) is another VGAM2505 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37310, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84905] Another function of VGAM2505 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC132625 (Accession XM_067946) is another VGAM2505 host target gene. LOC132625 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132625 BINDING SITE, designated SEQ ID:37373, to

the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84906] Another function of VGAM2505 is therefore inhibition of LOC132625 (Accession XM_067946). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132625. LOC135818 (Accession XM_059804) is another VGAM2505 host target gene. LOC135818 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:37093, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84907] Another function of VGAM2505 is therefore inhibition of LOC135818 (Accession XM_059804). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818. LOC143187 (Accession NM_145206) is another VGAM2505 host target gene. LOC143187 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC143187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143187 BINDING SITE, designated SEQ ID:29744, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84908] Another function of VGAM2505 is therefore inhibition of LOC143187 (Accession NM_145206). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143187. LOC144248 (Accession XM_084786) is another VGAM2505 host target gene. LOC144248 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144248 BINDING SITE, designated SEQ ID:37700, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84909] Another function of VGAM2505 is therefore inhibition of LOC144248 (Accession XM_084786). Accordingly, utilities

of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144248. LOC144524 (Accession XM_096624) is another VGAM2505 host target gene. LOC144524 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144524 BINDING SITE, designated SEQ ID:40433, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84910] Another function of VGAM2505 is therefore inhibition of LOC144524 (Accession XM_096624). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144524. LOC145468 (Accession XM_057874) is another VGAM2505 host target gene. LOC145468 BINDING SITE1 and LOC145468 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC145468, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC145468 BINDING SITE1 and LOC145468 BINDING SITE2, designated SEQ ID:36545 and SEQ ID:36546 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84911] Another function of VGAM2505 is therefore inhibition of LOC145468 (Accession XM_057874). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145468. LOC145693 (Accession XM_085205) is another VGAM2505 host target gene. LOC145693 BINDING SITE1 and LOC145693 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC145693, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145693 BINDING SITE1 and LOC145693 BINDING SITE2, designated SEQ ID:37924 and SEQ ID:38031 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84912] Another function of VGAM2505 is therefore inhibition of LOC145693 (Accession XM_085205). Accordingly, utilities

of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145693. LOC146733 (Accession XM_097076) is another VGAM2505 host target gene. LOC146733 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40729, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84913] Another function of VGAM2505 is therefore inhibition of LOC146733 (Accession XM_097076). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC146784 (Accession XM_085588) is another VGAM2505 host target gene. LOC146784 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146784 BINDING SITE, designated SEQ ID:38237, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84914] Another function of VGAM2505 is therefore inhibition of LOC146784 (Accession XM_085588). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784. LOC146839 (Accession XM_097107) is another VGAM2505 host target gene. LOC146839 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146839 BINDING SITE, designated SEQ ID:40753, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84915] Another function of VGAM2505 is therefore inhibition of LOC146839 (Accession XM_097107). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146839. LOC146957 (Accession XM_085652) is another VGAM2505 host target gene. LOC146957 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38284, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84916] Another function of VGAM2505 is therefore inhibition of LOC146957 (Accession XM_085652). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC147817 (Accession XM_085903) is another VGAM2505 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38384, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84917] Another function of VGAM2505 is therefore inhibition of

LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC147958 (Accession XM_103258) is another VGAM2505 host target gene. LOC147958 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147958 BINDING SITE, designated SEQ ID:42152, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84918] Another function of VGAM2505 is therefore inhibition of LOC147958 (Accession XM_103258). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147958. LOC148137 (Accession NM_144692) is another VGAM2505 host target gene. LOC148137 BINDING SITE1 and LOC148137 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC148137, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE1 and LOC148137 BINDING SITE2, designated SEQ ID:29514 and SEQ ID:29515 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84919] Another function of VGAM2505 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC149506 (Accession XM_097661) is another VGAM2505 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41000, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84920] Another function of VGAM2505 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149506. LOC149577 (Accession XM_097675) is another VGAM2505 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41024, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84921] Another function of VGAM2505 is therefore inhibition of LOC149577 (Accession XM_097675). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577. LOC150155 (Accession XM_047977) is another VGAM2505 host target gene. LOC150155 BINDING SITE1 and LOC150155 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC150155, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150155 BINDING SITE1

and LOC150155 BINDING SITE2, designated SEQ ID:35086 and SEQ ID:35087 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84922] Another function of VGAM2505 is therefore inhibition of LOC150155 (Accession XM_047977). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150155. LOC151201 (Accession XM_098021) is another VGAM2505 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41321, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84923] Another function of VGAM2505 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC151475 (Accession XM_098063) is an-

other VGAM2505 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41355, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84924] Another function of VGAM2505 is therefore inhibition of LOC151475 (Accession XM_098063). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC153525 (Accession XM_098383) is another VGAM2505 host target gene. LOC153525 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153525 BINDING SITE, designated SEQ ID:41638, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84925] Another function of VGAM2505 is therefore inhibition of LOC153525 (Accession XM_098383). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153525. LOC153688 (Accession XM_098416) is another VGAM2505 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41658, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84926] Another function of VGAM2505 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC154282 (Accession XM_098505) is another VGAM2505 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41698, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84927] Another function of VGAM2505 is therefore inhibition of LOC154282 (Accession XM_098505). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC154726 (Accession XM_088024) is another VGAM2505 host target gene. LOC154726 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154726 BINDING SITE, designated SEQ ID:39477, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84928] Another function of VGAM2505 is therefore inhibition of LOC154726 (Accession XM_088024). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC154726. LOC155006 (Accession XM_088117) is another VGAM2505 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39523, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84929] Another function of VGAM2505 is therefore inhibition of LOC155006 (Accession XM_088117). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC157247 (Accession XM_088275) is another VGAM2505 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39576, to the nucleotide sequence of VGAM2505 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5216.

[84930] Another function of VGAM2505 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC195977 (Accession XM_113625) is another VGAM2505 host target gene. LOC195977 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC195977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:42300, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84931] Another function of VGAM2505 is therefore inhibition of LOC195977 (Accession XM_113625). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977. LOC200014 (Accession XM_114087) is another VGAM2505 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200014, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42689, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84932] Another function of VGAM2505 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC200314 (Accession XM_117225) is another VGAM2505 host target gene. LOC200314 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200314 BINDING SITE, designated SEQ ID:43293, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84933] Another function of VGAM2505 is therefore inhibition of LOC200314 (Accession XM_117225). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200314. LOC200860 (Accession XM_117289) is another VGAM2505 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43353, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84934] Another function of VGAM2505 is therefore inhibition of LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. LOC204804 (Accession XM_115599) is another VGAM2505 host target gene. LOC204804 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC204804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:43097, to

the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84935] Another function of VGAM2505 is therefore inhibition of LOC204804 (Accession XM_115599). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204804. LOC219653 (Accession XM_166093) is another VGAM2505 host target gene. LOC219653 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219653 BINDING SITE, designated SEQ ID:43869, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84936] Another function of VGAM2505 is therefore inhibition of LOC219653 (Accession XM_166093). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219653. LOC219920 (Accession XM_167787) is another VGAM2505 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44804, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84937] Another function of VGAM2505 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC220662 (Accession XM_165978) is another VGAM2505 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43822, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84938] Another function of VGAM2505 is therefore inhibition of LOC220662 (Accession XM_165978). Accordingly, utilities

of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662. LOC221250 (Accession XM_166301) is another VGAM2505 host target gene. LOC221250 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221250 BINDING SITE, designated SEQ ID:44117, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84939] Another function of VGAM2505 is therefore inhibition of LOC221250 (Accession XM_166301). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221250. LOC221296 (Accession XM_166325) is another VGAM2505 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221296 BINDING SITE, designated SEQ ID:44167, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84940] Another function of VGAM2505 is therefore inhibition of LOC221296 (Accession XM_166325). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221296. LOC221336 (Accession XM_166427) is another VGAM2505 host target gene. LOC221336 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221336 BINDING SITE, designated SEQ ID:44319, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84941] Another function of VGAM2505 is therefore inhibition of LOC221336 (Accession XM_166427). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221336. LOC221424 (Accession XM_168060) is another VGAM2505 host target gene. LOC221424 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221424 BINDING SITE, designated SEQ ID:44978, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84942] Another function of VGAM2505 is therefore inhibition of LOC221424 (Accession XM_168060). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221424. LOC221663 (Accession XM_168131) is another VGAM2505 host target gene. LOC221663 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:45039, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84943] Another function of VGAM2505 is therefore inhibition of

LOC221663 (Accession XM_168131). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663. LOC253092 (Accession XM_173583) is another VGAM2505 host target gene. LOC253092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253092 BINDING SITE, designated SEQ ID:46549, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84944] Another function of VGAM2505 is therefore inhibition of LOC253092 (Accession XM_173583). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253092. LOC254428 (Accession XM_170932) is another VGAM2505 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45716, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84945] Another function of VGAM2505 is therefore inhibition of LOC254428 (Accession XM_170932). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC255177 (Accession XM_172941) is another VGAM2505 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:46201, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84946] Another function of VGAM2505 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. LOC256306 (Accession XM_172976) is an-

other VGAM2505 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:46236, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84947] Another function of VGAM2505 is therefore inhibition of LOC256306 (Accession XM_172976). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. LOC257468 (Accession XM_170838) is another VGAM2505 host target gene. LOC257468 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257468 BINDING SITE, designated SEQ ID:45626, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84948] Another function of VGAM2505 is therefore inhibition of LOC257468 (Accession XM_170838). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257468. LOC51193 (Accession NM_016331) is another VGAM2505 host target gene. LOC51193 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51193 BINDING SITE, designated SEQ ID:18455, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84949] Another function of VGAM2505 is therefore inhibition of LOC51193 (Accession NM_016331). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51193. LOC51219 (Accession NM_016418) is another VGAM2505 host target gene. LOC51219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51219, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51219 BINDING SITE, designated SEQ ID:18544, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84950] Another function of VGAM2505 is therefore inhibition of LOC51219 (Accession NM_016418). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51219. LOC81034 (Accession NM_030780) is another VGAM2505 host target gene. LOC81034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC81034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81034 BINDING SITE, designated SEQ ID:25069, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84951] Another function of VGAM2505 is therefore inhibition of LOC81034 (Accession NM_030780). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC81034. LOC89932 (Accession XM_027341) is another VGAM2505 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30488, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84952] Another function of VGAM2505 is therefore inhibition of LOC89932 (Accession XM_027341). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. LOC90288 (Accession XM_030669) is another VGAM2505 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31106, to the nucleotide sequence of VGAM2505 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5216.

[84953] Another function of VGAM2505 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC90371 (Accession XM_031261) is another VGAM2505 host target gene. LOC90371 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90371 BINDING SITE, designated SEQ ID:31320, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84954] Another function of VGAM2505 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. LOC90591 (Accession XM_032811) is another VGAM2505 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90591, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31756, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84955] Another function of VGAM2505 is therefore inhibition of LOC90591 (Accession XM_032811). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. LOC91115 (Accession XM_036218) is another VGAM2505 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32394, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84956] Another function of VGAM2505 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91115. LOC91252 (Accession XM_037173) is another VGAM2505 host target gene. LOC91252 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91252 BINDING SITE, designated SEQ ID:32552, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84957] Another function of VGAM2505 is therefore inhibition of LOC91252 (Accession XM_037173). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91252. LOC92267 (Accession XM_043979) is another VGAM2505 host target gene. LOC92267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92267 BINDING SITE, designated SEQ ID:34054, to the

nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84958] Another function of VGAM2505 is therefore inhibition of LOC92267 (Accession XM_043979). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92267. LOC92697 (Accession XM_046715) is another VGAM2505 host target gene. LOC92697 BINDING SITE1 and LOC92697 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC92697, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE1 and LOC92697 BINDING SITE2, designated SEQ ID:34800 and SEQ ID:34801 respectively, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84959] Another function of VGAM2505 is therefore inhibition of LOC92697 (Accession XM_046715). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. Protocadherin 11 X-linked (PCDH11X, Acces-

sion NM_032968) is another VGAM2506 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26785 and SEQ ID:26800 respectively, to the nucleotide sequence of VGAM2506 RNA, herein designated VGAM RNA, also designated SEQ ID:5217.

[84960] Another function of VGAM2506 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.LOC124602 (Accession XM_058829) is another

VGAM2506 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36759, to the nucleotide sequence of VGAM2506 RNA, herein designated VGAM RNA, also designated SEQ ID:5217.

[84961] Another function of VGAM2506 is therefore inhibition of LOC124602 (Accession XM_058829). Accordingly, utilities of VGAM2506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC201229 (Accession XM_113925) is another VGAM2506 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42540, to the nucleotide sequence of VGAM2506 RNA, herein designated VGAM RNA, also designated SEQ ID:5217.

[84962] Another function of VGAM2506 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM2506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC203397 (Accession XM_114695) is another VGAM2506 host target gene. LOC203397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203397 BINDING SITE, designated SEQ ID:43039, to the nucleotide sequence of VGAM2506 RNA, herein designated VGAM RNA, also designated SEQ ID:5217.

[84963] Another function of VGAM2506 is therefore inhibition of LOC203397 (Accession XM_114695). Accordingly, utilities of VGAM2506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2507 (VGAM2507) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[84964] VGAM2507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2507 was detected is described hereinabove with reference to Figs. 1-8.

[84965] VGAM2507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84966] VGAM2507 gene encodes a VGAM2507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2507 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2507 precursor RNA is designated SEQ ID:2493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2493 is located at position 38544 relative to the genome of Mouse Cytomegalovirus 1.

[84967] VGAM2507 precursor RNA folds onto itself, forming VGAM2507 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84968] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2507 folded precursor RNA into VGAM2507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2507 RNA is designated SEQ ID:5218, and is provided hereinbelow with reference to the sequence listing part.

[84969] VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2507 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84970] VGAM2507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2507 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84971] The complementary binding of VGAM2507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2507 host target RNA into VGAM2507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84972] It is appreciated that VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2507 host target genes. The mRNA of each one of this plurality of VGAM2507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2507 RNA, herein designated VGAM RNA, and which when bound by VGAM2507 RNA causes inhibition of translation of respective one or more VGAM2507 host target proteins.

[84973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2507 gene, herein designated VGAM GENE, on one or more VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84974] It is yet further appreciated that a function of VGAM2507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2507 correlate with, and may be deduced from, the identity of the host target genes which VGAM2507 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[84975] Nucleotide sequences of the VGAM2507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2507 are further described hereinbelow with reference to Table 1.

[84976] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2507 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84977] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2507 gene, herein designated VGAM is inhibition of expression of VGAM2507 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2507 correlate with, and may be deduced from, the identity of the target genes which VGAM2507 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84978] BCL2-like 2 (BCL2L2, Accession NM_004050) is a VGAM2507 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10258, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84979] A function of VGAM2507 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431.Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517) is another VGAM2507 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13268, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84980] Another function of VGAM2507 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2. FLJ14525 (Accession NM_032800) is another VGAM2507 host target gene. FLJ14525 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14525 BINDING SITE, designated SEQ ID:26548, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84981] Another function of VGAM2507 is therefore inhibition of FLJ14525 (Accession NM_032800). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14525. FLJ20378 (Accession NM_017795) is another VGAM2507 host target gene. FLJ20378 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20378 BINDING SITE, designated SEQ ID:19435, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84982] Another function of VGAM2507 is therefore inhibition of FLJ20378 (Accession NM_017795). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20378. Thyroid Hormone Receptor Interactor 13 (TRIP13, Accession NM_004237) is another VGAM2507 host target gene. TRIP13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP13, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP13 BINDING SITE, designated SEQ ID:10434, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84983] Another function of VGAM2507 is therefore inhibition of Thyroid Hormone Receptor Interactor 13 (TRIP13, Accession NM_004237). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP13. LOC120939 (Accession XM_073688) is another VGAM2507 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37513, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84984] Another function of VGAM2507 is therefore inhibition of LOC120939 (Accession XM_073688). Accordingly, utilities

of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC152200 (Accession XM_098174) is another VGAM2507 host target gene. LOC152200 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152200 BINDING SITE, designated SEQ ID:41438, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84985] Another function of VGAM2507 is therefore inhibition of LOC152200 (Accession XM_098174). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152200. LOC203276 (Accession XM_117523) is another VGAM2507 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC203276 BINDING SITE, designated SEQ ID:43488, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84986] Another function of VGAM2507 is therefore inhibition of LOC203276 (Accession XM_117523). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM_117529) is another VGAM2507 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43512, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84987] Another function of VGAM2507 is therefore inhibition of LOC203305 (Accession XM_117529). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC255696 (Accession XM_173933) is another VGAM2507 host target gene. LOC255696 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255696 BINDING SITE, designated SEQ ID:46567, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84988] Another function of VGAM2507 is therefore inhibition of LOC255696 (Accession XM_173933). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255696. LOC90019 (Accession NM_138567) is another VGAM2507 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:28870, to the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, also designated SEQ ID:5218.

[84989] Another function of VGAM2507 is therefore inhibition of

LOC90019 (Accession NM_138567). Accordingly, utilities of VGAM2507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2508 (VGAM2508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84990] VGAM2508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2508 was detected is described hereinabove with reference to Figs. 1-8.

[84991] VGAM2508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84992] VGAM2508 gene encodes a VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2508 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2508 precursor RNA is designated SEQ ID:2494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2494 is located at position 168766 relative to the genome of Mouse Cytomegalovirus 1.

[84993] VGAM2508 precursor RNA folds onto itself, forming VGAM2508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84994] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2508 folded precursor RNA into VGAM2508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2508 RNA is designated SEQ ID:5219, and is provided hereinbelow with reference to the sequence listing part.

[84995] VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2508 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84996] VGAM2508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2508 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84997] The complementary binding of VGAM2508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2508 host target RNA into VGAM2508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84998] It is appreciated that VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2508 host target genes. The mRNA of each one of this plurality of VGAM2508 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2508 RNA, herein designated VGAM RNA, and which when bound by VGAM2508 RNA causes inhibition of translation of respective one or more VGAM2508 host target proteins.

[84999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2508 gene, herein designated VGAM GENE, on one or more VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85000] It is yet further appreciated that a function of VGAM2508

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2508 correlate with, and may be deduced from, the identity of the host target genes which VGAM2508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85001] Nucleotide sequences of the VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2508 are further described hereinbelow with reference to Table 1.

[85002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2508 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2508 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85003] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2508 gene, herein designated VGAM is inhibition of expression of VGAM2508 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2508 correlate with, and may be deduced from, the identity of the target genes which VGAM2508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85004] Aristaless-like Homeobox 3 (ALX3, Accession NM_006492) is a VGAM2508 host target gene. ALX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALX3 BINDING SITE, designated SEQ ID:13222, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85005] A function of VGAM2508 is therefore inhibition of Aristaless-like Homeobox 3 (ALX3, Accession NM_006492), a gene which is involved in cell-type differentiation and development. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with ALX3. The function of ALX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 (X11-like) (APBA2, Accession NM_005503) is another VGAM2508 host target gene. APBA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA2 BINDING SITE, designated SEQ ID:12018, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85006] Another function of VGAM2508 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 (X11-like) (APBA2, Accession NM_005503), a gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

APBA2. The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM925.Bone Morphogenetic Protein 1 (BMP1, Accession NM_006131) is another VGAM2508 host target gene. BMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE, designated SEQ ID:12768, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85007] Another function of VGAM2508 is therefore inhibition of Bone Morphogenetic Protein 1 (BMP1, Accession NM_006131), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1. The function of BMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with refer-

ence to VGAM247.Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM_004349) is another VGAM2508 host target gene. CBFA2T1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CBFA2T1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T1 BINDING SITE, designated SEQ ID:10543, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85008] Another function of VGAM2508 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM_004349), a gene which produces a chimeric gene made up of the 5-prime region of the AML1 gene fused to the 3-prime region of the ETO gene through translocation. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T1. The function of CBFA2T1 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM113.Cell Division Cycle 25B (CDC25B, Accession NM_021874) is another VGAM2508 host target gene. CDC25B BINDING SITE1 and CDC25B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC25B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC25B BINDING SITE1 and CDC25B BINDING SITE2, designated SEQ ID:22417 and SEQ ID:22413 respectively, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85009] Another function of VGAM2508 is therefore inhibition of Cell Division Cycle 25B (CDC25B, Accession NM_021874), a gene which is positively activated by dephosphorylation. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC25B. The function of CDC25B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165.EPB72 (Accession NM_004099) is another VGAM2508 host target

gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:10304, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85010] Another function of VGAM2508 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1560.Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670) is another VGAM2508 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:12227, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85011] Another function of VGAM2508 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM470.Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028) is another VGAM2508 host target gene. FNTB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FNTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNTB BINDING SITE, designated SEQ ID:7781,

to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85012] Another function of VGAM2508 is therefore inhibition of Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028), a gene which transfers farnesyl groups to proteins. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNTB. The function of FNTB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM615.Guanine Nucleotide-releasing Factor 2 (specific for crk proto-oncogene) (GRF2, Accession NM_005312) is another VGAM2508 host target gene. GRF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRF2 BINDING SITE, designated SEQ ID:11790, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85013] Another function of VGAM2508 is therefore inhibition of

Guanine Nucleotide-releasing Factor 2 (specific for crk proto-oncogene) (GRF2, Accession NM_005312), a gene which promotes the exchange of ras-bound gdp by gtp. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRF2. The function of GRF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Hepsin (transmembrane protease, serine 1) (HPN, Accession NM_002151) is another VGAM2508 host target gene. HPN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPN BINDING SITE, designated SEQ ID:7932, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85014] Another function of VGAM2508 is therefore inhibition of Hepsin (transmembrane protease, serine 1) (HPN, Accession NM_002151), a gene which is a cell surface serine protease. Accordingly, utilities of VGAM2508 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with HPN. The function of HPN has been established by previous studies. Hepsin is a cell surface serine protease. From cDNA libraries prepared from human liver and hepatoma cell line mRNA, Leytus et al. (1988) isolated cDNA clones coding for a serine protease called hepsin. The proteolytic enzymes of the serine protease family exist as single- or 2-chain zymogenes that are activated by a specific and limited proteolytic cleavage. They contain 3 principal active-site amino acids, his, asp, and ser, that participate in peptide bond hydrolysis. Among the best-studied serine proteases are those found in plasma. These enzymes are involved in processes such as blood coagulation, fibrinolysis, and complement activation. Tsuji et al. (1991) showed that the hepsin mRNA is 1.85 kb in size and present in most tissues, with the highest level in liver. It is present in the plasma membrane in a molecular orientation of type II membrane-associated proteins, with its catalytic subunit (C-terminal half) at the cell surface and its N terminus facing the cytosol. Hepsin is not found in cytosol. See also TMPRSS2 (OMIM Ref. No. 602060), a related serine protease. Animal model experiments lend further support to the function of HPN. To de-

termine the functional importance of hepsin, Wu et al. (1998) generated hepsin-deficient mice by homologous recombination. The homozygous deficient mice were viable and fertile, and grew normally. In functional assays, including tail bleeding time, plasma clotting times, and tissue factor- or LPS-induced disseminated intravascular coagulation models, no significant difference was found between hepsin -/- and wildtype littermates. Liver weight and serum concentrations of liver-derived proteins and enzymes were similar. Serum concentrations of bone-derived alkaline phosphatase were approximately 2-fold higher in hepsin -/- mice of both sexes when compared with wildtype littermates. No obvious abnormalities were found in major organs in hepsin -/- mice on histologic examination. The results indicated that hepsin is not essential for embryonic development and normal hemostasis.

[85015] It is appreciated that the abovementioned animal model for HPN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[85016] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[85017] Leytus, S. P.; Loeb, K. R.; Hagen, F. S.; Kurachi, K.; Davie, E. W. : A novel trypsin-like serine protease (hepsin) with a putative transmembrane domain expressed by human liver and hepatoma cells. Biochemistry 27: 1067-1074, 1988. ; and

[85018] Tsuji, A.; Torres-Rosado, A.; Arai, T.; Le Beau, M. M.; Lemons, R. S.; Chou, S.-H.; Kurachi, K. : Hepsin, a cell membrane-associated protease: characterization, tissue distribution, and.

[85019] Further studies establishing the function and utilities of HPN are found in John Hopkins OMIM database record ID 142440, and in sited publications numbered 11565-11568 listed in the bibliography section hereinbe-low, which are also hereby incorporated by refer-ence.Integral Membrane Protein 2B (ITM2B, Accession NM_021999) is another VGAM2508 host target gene. ITM2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-quences of ITM2B BINDING SITE, designated SEQ

ID:22539, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85020] Another function of VGAM2508 is therefore inhibition of Integral Membrane Protein 2B (ITM2B, Accession NM_021999), a gene which is a member of the type II integral membrane protein family. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM2B. The function of ITM2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM458.Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355) is another VGAM2508 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30083, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85021] Another function of VGAM2508 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. Mucin and Cadherin-like (MUCDHL, Accession NM_031265) is another VGAM2508 host target gene. MUCDHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MUCDHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUCDHL BINDING SITE, designated SEQ ID:25283, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85022] Another function of VGAM2508 is therefore inhibition of Mucin and Cadherin-like (MUCDHL, Accession NM_031265). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUCDHL. Nuclear Receptor Co-repressor 2 (NCOR2, Accession NM_006312) is another VGAM2508 host target gene. NCOR2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOR2 BINDING SITE, designated SEQ ID:13003, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85023] Another function of VGAM2508 is therefore inhibition of Nuclear Receptor Co-repressor 2 (NCOR2, Accession NM_006312), a gene which mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOR2. The function of NCOR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2346.Nuclear Factor I/A (NFIA, Accession XM_046827) is another VGAM2508 host target gene. NFIA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFIA, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIA BINDING SITE, designated SEQ ID:34842, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85024] Another function of VGAM2508 is therefore inhibition of Nuclear Factor I/A (NFIA, Accession XM_046827). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIA. Ninjurin 1 (NINJ1, Accession NM_004148) is another VGAM2508 host target gene. NINJ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NINJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ1 BINDING SITE, designated SEQ ID:10351, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85025] Another function of VGAM2508 is therefore inhibition of Ninjurin 1 (NINJ1, Accession NM_004148), a gene which may play a role in nerve regeneration and in the formation

and function of other tissues. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ1. The function of NINJ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1927.Neuronal Pentraxin I (NPTX1, Accession NM_002522) is another VGAM2508 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8355, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85026] Another function of VGAM2508 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570) is another VGAM2508 host target gene. PACE4 BINDING SITE1 through PACE4 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACE4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE1 through PACE4 BINDING SITE6, designated SEQ ID:8430, SEQ ID:28723, SEQ ID:28724, SEQ ID:28725, SEQ ID:28719 and SEQ ID:28722 respectively, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85027] Another function of VGAM2508 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1194.Plexin B2 (PLXNB2, Accession NM_012401) is another VGAM2508 host target gene. PLXNB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLXNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNB2 BINDING SITE, designated SEQ ID:14777, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85028] Another function of VGAM2508 is therefore inhibition of Plexin B2 (PLXNB2, Accession NM_012401), a gene which is a novel member of the plexin family. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNB2. The function of PLXNB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87.Retinoic Acid Induced 14 (RAI14, Accession NM_015577) is another VGAM2508

host target gene. RAI14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI14 BINDING SITE, designated SEQ ID:17845, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85029] Another function of VGAM2508 is therefore inhibition of Retinoic Acid Induced 14 (RAI14, Accession NM_015577), a gene which is required for protein transport from the er to the golgi complex. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI14. The function of RAI14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1036.Sialic Acid Binding Ig-like Lectin 11 (SIGLEC11, Accession NM_052884) is another VGAM2508 host target gene. SIGLEC11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIGLEC11, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIGLEC11 BINDING SITE, designated SEQ ID:27465, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85030] Another function of VGAM2508 is therefore inhibition of Sialic Acid Binding Ig-like Lectin 11 (SIGLEC11, Accession NM_052884). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC11. Zinc Finger Protein 205 (ZNF205, Accession NM_003456) is another VGAM2508 host target gene. ZNF205 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF205 BINDING SITE, designated SEQ ID:9513, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85031] Another function of VGAM2508 is therefore inhibition of Zinc Finger Protein 205 (ZNF205, Accession NM_003456).

Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF205. DKFZp434E2220 (Accession NM_017612) is another VGAM2508 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19110, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85032] Another function of VGAM2508 is therefore inhibition of DKFZp434E2220 (Accession NM_017612). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. Ets2 Repressor Factor (ERF, Accession NM_006494) is another VGAM2508 host target gene. ERF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of ERF BINDING SITE, designated SEQ ID:13236, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85033] Another function of VGAM2508 is therefore inhibition of Ets2 Repressor Factor (ERF, Accession NM_006494). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERF. Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206) is another VGAM2508 host target gene. FER1L4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FER1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:24873, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85034] Another function of VGAM2508 is therefore inhibition of Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with FER1L4. FLJ10709 (Accession NM_018188) is another VGAM2508 host target gene. FLJ10709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10709 BINDING SITE, designated SEQ ID:20038, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85035] Another function of VGAM2508 is therefore inhibition of FLJ10709 (Accession NM_018188). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10709. FLJ10743 (Accession NM_018201) is another VGAM2508 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20078, to the nucleotide

sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85036] Another function of VGAM2508 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ12586 (Accession NM_024620) is another VGAM2508 host target gene. FLJ12586 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:23882, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85037] Another function of VGAM2508 is therefore inhibition of FLJ12586 (Accession NM_024620). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586. FLJ13710 (Accession NM_024817) is another VGAM2508 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24207, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85038] Another function of VGAM2508 is therefore inhibition of FLJ13710 (Accession NM_024817). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710. FLJ14327 (Accession NM_024912) is another VGAM2508 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24426, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85039] Another function of VGAM2508 is therefore inhibition of FLJ14327 (Accession NM_024912). Accordingly, utilities of

VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ14351 (Accession NM_024732) is another VGAM2508 host target gene. FLJ14351 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14351 BINDING SITE, designated SEQ ID:24070, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85040] Another function of VGAM2508 is therefore inhibition of FLJ14351 (Accession NM_024732). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14351. FLJ20647 (Accession NM_017918) is another VGAM2508 host target gene. FLJ20647 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20647

BINDING SITE, designated SEQ ID:19571, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85041] Another function of VGAM2508 is therefore inhibition of FLJ20647 (Accession NM_017918). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20647. FLJ21736 (Accession NM_024922) is another VGAM2508 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24461, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85042] Another function of VGAM2508 is therefore inhibition of FLJ21736 (Accession NM_024922). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. FLJ32884 (Accession NM_144702) is another VGAM2508 host target gene. FLJ32884 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32884 BINDING SITE, designated SEQ ID:29528, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85043] Another function of VGAM2508 is therefore inhibition of FLJ32884 (Accession NM_144702). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32884. FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM_021910) is another VGAM2508 host target gene. FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FXYD3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2, designated SEQ ID:22436 and SEQ ID:12593 respectively, to the nucleotide sequence of VGAM2508 RNA,

herein designated VGAM RNA, also designated SEQ ID:5219.

[85044] Another function of VGAM2508 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM_021910). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3. KIAA0481 (Accession XM_050144) is another VGAM2508 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35568, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85045] Another function of VGAM2508 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0481. KIAA1026 (Accession XM_048825) is another VGAM2508 host target gene. KIAA1026 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35275, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85046] Another function of VGAM2508 is therefore inhibition of KIAA1026 (Accession XM_048825). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1126 (Accession XM_050325) is another VGAM2508 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35607, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85047] Another function of VGAM2508 is therefore inhibition of

KIAA1126 (Accession XM_050325). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. KIAA1344 (Accession XM_051699) is another VGAM2508 host target gene. KIAA1344 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35870, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85048] Another function of VGAM2508 is therefore inhibition of KIAA1344 (Accession XM_051699). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. KIAA1416 (Accession XM_098762) is another VGAM2508 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41808, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85049] Another function of VGAM2508 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1538 (Accession XM_049474) is another VGAM2508 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35424, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85050] Another function of VGAM2508 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1854 (Accession XM_049884) is another

VGAM2508 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35533, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85051] Another function of VGAM2508 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1889 (Accession XM_056298) is another VGAM2508 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE, designated SEQ ID:36388, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85052] Another function of VGAM2508 is therefore inhibition of KIAA1889 (Accession XM_056298). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. MGC13057 (Accession NM_032321) is another VGAM2508 host target gene. MGC13057 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13057 BINDING SITE, designated SEQ ID:26124, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85053] Another function of VGAM2508 is therefore inhibition of MGC13057 (Accession NM_032321). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13057. MGC21621 (Accession NM_145015) is another VGAM2508 host target gene. MGC21621 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC21621, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21621 BINDING SITE, designated SEQ ID:29622, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85054] Another function of VGAM2508 is therefore inhibition of MGC21621 (Accession NM_145015). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21621. MGC2474 (Accession NM_023931) is another VGAM2508 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23416, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85055] Another function of VGAM2508 is therefore inhibition of MGC2474 (Accession NM_023931). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2474. MGC2555 (Accession NM_032772) is another VGAM2508 host target gene. MGC2555 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2555 BINDING SITE, designated SEQ ID:26519, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85056] Another function of VGAM2508 is therefore inhibition of MGC2555 (Accession NM_032772). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2555. moblak (Accession NM_130807) is another VGAM2508 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28304, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA,

also designated SEQ ID:5219.

[85057] Another function of VGAM2508 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. QKI (Accession XM_037438) is another VGAM2508 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:32618, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85058] Another function of VGAM2508 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. RoXaN (Accession NM_025013) is another VGAM2508 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24602, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85059] Another function of VGAM2508 is therefore inhibition of RoXaN (Accession NM_025013). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. SES2 (Accession NM_031459) is another VGAM2508 host target gene. SES2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SES2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SES2 BINDING SITE, designated SEQ ID:25482, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85060] Another function of VGAM2508 is therefore inhibition of SES2 (Accession NM_031459). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SES2. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM2508 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9099, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85061] Another function of VGAM2508 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM_014517) is another VGAM2508 host target gene. UBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBP1 BINDING SITE, designated SEQ ID:15850, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85062] Another function of VGAM2508 is therefore inhibition of Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM_014517). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1. Zinc Finger Protein 145 (Kruppel-like, expressed in promyelocytic leukemia) (ZNF145, Accession NM_006006) is another VGAM2508 host target gene. ZNF145 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF145 BINDING SITE, designated SEQ ID:12618, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85063] Another function of VGAM2508 is therefore inhibition of Zinc Finger Protein 145 (Kruppel-like, expressed in

promyelocytic leukemia) (ZNF145, Accession NM_006006). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF145. LOC124842 (Accession XM_064333) is another VGAM2508 host target gene. LOC124842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124842 BINDING SITE, designated SEQ ID:37260, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85064] Another function of VGAM2508 is therefore inhibition of LOC124842 (Accession XM_064333). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124842. LOC145481 (Accession XM_085163) is another VGAM2508 host target gene. LOC145481 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145481, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145481 BINDING SITE, designated SEQ ID:37889, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85065] Another function of VGAM2508 is therefore inhibition of LOC145481 (Accession XM_085163). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145481. LOC147341 (Accession XM_097223) is another VGAM2508 host target gene. LOC147341 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147341 BINDING SITE, designated SEQ ID:40827, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85066] Another function of VGAM2508 is therefore inhibition of LOC147341 (Accession XM_097223). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147341. LOC148809 (Accession XM_086325) is another VGAM2508 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38594, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85067] Another function of VGAM2508 is therefore inhibition of LOC148809 (Accession XM_086325). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC150319 (Accession XM_086816) is another VGAM2508 host target gene. LOC150319 BINDING SITE1 and LOC150319 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC150319, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150319 BINDING SITE1 and LOC150319 BINDING SITE2, designated SEQ ID:38893

and SEQ ID:38896 respectively, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85068] Another function of VGAM2508 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. LOC157349 (Accession XM_088298) is another VGAM2508 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39588, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85069] Another function of VGAM2508 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC157737 (Accession XM_098819) is another VGAM2508 host target gene. LOC157737 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157737 BINDING SITE, designated SEQ ID:41843, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85070] Another function of VGAM2508 is therefore inhibition of LOC157737 (Accession XM_098819). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157737. LOC166879 (Accession XM_106298) is another VGAM2508 host target gene. LOC166879 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166879 BINDING SITE, designated SEQ ID:42197, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85071] Another function of VGAM2508 is therefore inhibition of

LOC166879 (Accession XM_106298). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166879. LOC196746 (Accession XM_113595) is another VGAM2508 host target gene. LOC196746 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196746 BINDING SITE, designated SEQ ID:42288, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85072] Another function of VGAM2508 is therefore inhibition of LOC196746 (Accession XM_113595). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196746. LOC197196 (Accession XM_117003) is another VGAM2508 host target gene. LOC197196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:43201, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85073] Another function of VGAM2508 is therefore inhibition of LOC197196 (Accession XM_117003). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196. LOC199863 (Accession XM_117147) is another VGAM2508 host target gene. LOC199863 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199863 BINDING SITE, designated SEQ ID:43256, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85074] Another function of VGAM2508 is therefore inhibition of LOC199863 (Accession XM_117147). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199863. LOC203260 (Accession XM_114661) is an-

other VGAM2508 host target gene. LOC203260 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203260 BINDING SITE, designated SEQ ID:43022, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85075] Another function of VGAM2508 is therefore inhibition of LOC203260 (Accession XM_114661). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203260. LOC203378 (Accession XM_117541) is another VGAM2508 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43552, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85076] Another function of VGAM2508 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC220021 (Accession XM_167814) is another VGAM2508 host target gene. LOC220021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220021 BINDING SITE, designated SEQ ID:44850, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85077] Another function of VGAM2508 is therefore inhibition of LOC220021 (Accession XM_167814). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220021. LOC220776 (Accession XM_043388) is another VGAM2508 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33934, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85078] Another function of VGAM2508 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC254936 (Accession XM_170770) is another VGAM2508 host target gene. LOC254936 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:45528, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85079] Another function of VGAM2508 is therefore inhibition of LOC254936 (Accession XM_170770). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254936. LOC255271 (Accession XM_170945) is another VGAM2508 host target gene. LOC255271 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255271 BINDING SITE, designated SEQ ID:45727, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85080] Another function of VGAM2508 is therefore inhibition of LOC255271 (Accession XM_170945). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255271. LOC51008 (Accession NM_015947) is another VGAM2508 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18062, to the nucleotide sequence of VGAM2508 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5219.

[85081] Another function of VGAM2508 is therefore inhibition of LOC51008 (Accession NM_015947). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. LOC81569 (Accession XM_030465) is another VGAM2508 host target gene. LOC81569 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC81569, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81569 BINDING SITE, designated SEQ ID:31046, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85082] Another function of VGAM2508 is therefore inhibition of LOC81569 (Accession XM_030465). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81569. LOC89919 (Accession XM_027244) is another VGAM2508 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC89919, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30462, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85083] Another function of VGAM2508 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. LOC90019 (Accession NM_138567) is another VGAM2508 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:28873, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85084] Another function of VGAM2508 is therefore inhibition of LOC90019 (Accession NM_138567). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90019. LOC90355 (Accession NM_033211) is another VGAM2508 host target gene. LOC90355 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90355 BINDING SITE, designated SEQ ID:27063, to the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85085] Another function of VGAM2508 is therefore inhibition of LOC90355 (Accession NM_033211). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90355. LOC91252 (Accession XM_037173) is another VGAM2508 host target gene. LOC91252 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91252 BINDING SITE, designated SEQ ID:32554, to the

nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, also designated SEQ ID:5219.

[85086] Another function of VGAM2508 is therefore inhibition of LOC91252 (Accession XM_037173). Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2509 (VGAM2509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85087] VGAM2509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2509 was detected is described hereinabove with reference to Figs. 1-8.

[85088] VGAM2509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85089] VGAM2509 gene encodes a VGAM2509 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2509 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2509 precursor RNA is designated SEQ ID:2495, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2495 is located at position 220001 relative to the genome of Mouse Cytomegalovirus 1.

[85090] VGAM2509 precursor RNA folds onto itself, forming VGAM2509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85091] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2509 folded precursor RNA into VGAM2509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2509 RNA is designated SEQ ID:5220, and is provided hereinbelow with reference to the sequence listing part.

[85092] VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2509 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85093] VGAM2509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2509 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85094] The complementary binding of VGAM2509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2509 host target RNA into VGAM2509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85095] It is appreciated that VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2509 host target genes. The mRNA of each one of this plurality of VGAM2509 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2509 RNA, herein designated VGAM RNA, and which when bound by VGAM2509 RNA causes inhibition of translation of respective one or more VGAM2509 host target proteins.

[85096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2509 gene, herein designated VGAM GENE, on one or more VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85097] It is yet further appreciated that a function of VGAM2509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2509 correlate with, and may be deduced from, the identity of the host target genes which VGAM2509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85098] Nucleotide sequences of the VGAM2509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2509 are further described hereinbelow with reference to Table 1.

[85099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2509 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85100] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2509 gene, herein designated VGAM is inhibition of expression of VGAM2509 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2509 correlate with, and may be deduced from, the identity of the target genes which VGAM2509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85101] S-adenosylmethionine Decarboxylase 1 (AMD1, Accession NM_001634) is a VGAM2509 host target gene. AMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMD1 BINDING SITE, designated SEQ ID:7347, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85102] A function of VGAM2509 is therefore inhibition of S-adenosylmethionine Decarboxylase 1 (AMD1, Accession

NM_001634), a gene which catalyzes the removal of the carboxylate group of S-adenosylmethionine in the polyamine biosynthesis pathway. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMD1. The function of AMD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1016.B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326) is another VGAM2509 host target gene. BCL9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE, designated SEQ ID:10524, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85103] Another function of VGAM2509 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326), a gene which recruits of PYGO to the nuclear beta-catenin-TCF complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM2509 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Carbonic Anhydrase III, Muscle Specific (CA3, Accession NM_005181) is another VGAM2509 host target gene. CA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA3 BINDING SITE, designated SEQ ID:11681, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85104] Another function of VGAM2509 is therefore inhibition of Carbonic Anhydrase III, Muscle Specific (CA3, Accession NM_005181), a gene which has a muscle-specific function of reversible hydratation of carbon dioxide. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA3. The function of CA3 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM1911.Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116) is another VGAM2509 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPZA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35950, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85105] Another function of VGAM2509 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM547.Caspase Recruitment Domain

Family, Member 15 (CARD15, Accession NM_022162) is another VGAM2509 host target gene. CARD15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:22718, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85106] Another function of VGAM2509 is therefore inhibition of Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NFKB activation. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD15. The function of CARD15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000647) is another VGAM2509 host target

gene. CCR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR2 BINDING SITE, designated SEQ ID:6309, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85107] Another function of VGAM2509 is therefore inhibition of Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000647), a gene which binds chemokines and transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR2. The function of CCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782) is another VGAM2509 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CYP24, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6425, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85108] Another function of VGAM2509 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782), a gene which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24. The function of CYP24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1204.Desmoglein 1 (DSG1, Accession NM_001942) is another VGAM2509 host target gene. DSG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DSG1 BINDING SITE, designated SEQ ID:7657, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85109] Another function of VGAM2509 is therefore inhibition of Desmoglein 1 (DSG1, Accession NM_001942). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSG1. Ets Homologous Factor (EHF, Accession NM_012153) is another VGAM2509 host target gene. EHF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHF BINDING SITE, designated SEQ ID:14452, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85110] Another function of VGAM2509 is therefore inhibition of Ets Homologous Factor (EHF, Accession NM_012153), a gene which is Member of the ESE subfamily of Ets transcription factors. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHF. The function of

EHF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM855.Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666) is another VGAM2509 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:27395, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85111] Another function of VGAM2509 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM427.Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM_012215) is another VGAM2509 host target gene. MGEA5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGEA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA5 BINDING SITE, designated SEQ ID:14519, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85112] Another function of VGAM2509 is therefore inhibition of Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM_012215), a gene which has a hyaluronidase activity. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA5. The function of MGEA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801.Mature T-cell Proliferation 1 (MTCP1, Accession NM_014221) is another VGAM2509 host target gene. MTCP1 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15490, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85113] Another function of VGAM2509 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM_014221). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. poly(A) Binding Protein, Nuclear 1 (PABPN1, Accession NM_004643) is another VGAM2509 host target gene. PABPN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PABPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPN1 BINDING SITE, designated SEQ ID:11019, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85114] Another function of VGAM2509 is therefore inhibition of poly(A) Binding Protein, Nuclear 1 (PABPN1, Accession NM_004643), a gene which binds to Poly(A). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPN1. The function of PABPN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1968.Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789) is another VGAM2509 host target gene. PSME3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PSME3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSME3 BINDING SITE, designated SEQ ID:12373, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85115] Another function of VGAM2509 is therefore inhibition of Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789), a gene

which is the activator subunit of the proteasome (prosome macropain). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSME3. The function of PSME3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498.Spastic Paraplegia 3A (autosomal dominant) (SPG3A, Accession NM_015915) is another VGAM2509 host target gene. SPG3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPG3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPG3A BINDING SITE, designated SEQ ID:18047, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85116] Another function of VGAM2509 is therefore inhibition of Spastic Paraplegia 3A (autosomal dominant) (SPG3A, Accession NM_015915). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPG3A. Structure

Specific Recognition Protein 1 (SSRP1, Accession NM_003146) is another VGAM2509 host target gene. SSRP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SSRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSRP1 BINDING SITE, designated SEQ ID:9116, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85117] Another function of VGAM2509 is therefore inhibition of Structure Specific Recognition Protein 1 (SSRP1, Accession NM_003146), a gene which has specific affinity for DNA modified with cisplatin and has a region of homology to HMG-box DNA binding proteins. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSRP1. The function of SSRP1 has been established by previous studies. Members of the high mobility group (HMG) protein family (see OMIM Ref. No. HMG1, 163905) recognize specific DNA structures. By expression screening of a human B cell cDNA library, Bruhn et al. (1992) isolated cDNAs encoding a structure-specific recognition protein,

SSRP1, that binds specifically to DNA structurally modified by the antitumor drug cisplatin. The SSRP1 cDNA predicts a 709-amino acid protein with M(r) 81,068. The protein has a high percentage (36%) of charged residues grouped into several highly charged domains. SSRP1 has an HMG box located between amino acids 539-614. The SSRP1 protein shows homology to HMG1 and HMG2 (OMIM Ref. No. 163906) proteins from several species and to a transcription factor, UBF (OMIM Ref. No. 600673), which also has an HMG-box domain. Northern blot analysis identified a 2.8-kb transcript in all tissues examined. Northern blot analysis of mRNA from testicular and bladder cancer cell lines showed no correlation between SSRP1 mRNA levels and antitumor activity of cisplatin for these tissues. SSRP1 mRNA was not inducible by cisplatin in HeLa cells. Transcription of naked DNA in eukaryotic cells minimally requires the general transcription factors (see OMIM Ref. No. GTF2E1; 189962) and RNA polymerase II (see OMIM Ref. No. POLR2A; 180660). This minimal set of factors is not sufficient for transcription by RNA polymerase II in vivo, where DNA is packaged into chromatin by histone octamers (see OMIM Ref. No. 142711). One set of accessory factors involved in chromatin remodeling is the SWI/SNF

complex (see OMIM Ref. No. SMARCC1; 601732). By sequential chromatography, Orphanides et al. (1998) purified FACT (facilitates chromatin remodeling), an accessory factor required for transcript elongation after chromatin remodeling, from HeLa cell nuclear extracts. After the initiation of transcription, FACT acts to release RNA polymerase II from a nucleosome-induced block to allow productive transcription. SDS-PAGE and chromatographic analyses showed that FACT activity is present in an approximately 230-kD protein composed of 140-kD (FACTp140, or SPT16; 605012) and 80-kD (FACTp80) subunits.

[85118] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85119] Bruhn, S. L.; Pil, P. M.; Essigmann, J. M.; Housman, D. E.; Lippard, S. J. : Isolation and characterization of human cDNA clones encoding a high mobility group box protein that recognizes structural distortions to DNA caused by binding of the anticancer agent cisplatin. Proc. Nat. Acad. Sci. 89: 2307-2311, 1992. ; and

[85120] Orphanides, G.; LeRoy, G.; Chang, C.-H.; Luse, D. S.; Reinberg, D. : FACT, a factor that facilitates transcript elonga-

tion through nucleosomes. Cell 92: 105-116, 1998.

[85121] Further studies establishing the function and utilities of SSRP1 are found in John Hopkins OMIM database record ID 604328, and in sited publications numbered 7468, 1035 and 7469 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.T-box 3 (ulnar mammary syndrome) (TBX3, Accession NM_016569) is another VGAM2509 host target gene. TBX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX3 BINDING SITE, designated SEQ ID:18641, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85122] Another function of VGAM2509 is therefore inhibition of T-box 3 (ulnar mammary syndrome) (TBX3, Accession NM_016569). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX3. Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066) is another VGAM2509 host target gene.

TNFRSF1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF1B BINDING SITE, designated SEQ ID:6735, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85123] Another function of VGAM2509 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066), a gene which mediates proinflammatory cellular responses. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF1B. The function of TNFRSF1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM939.Tripartite Motif-containing 37 (TRIM37, Accession NM_015294) is another VGAM2509 host target gene. TRIM37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:17617, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85124] Another function of VGAM2509 is therefore inhibition of Tripartite Motif-containing 37 (TRIM37, Accession NM_015294). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37. TSLP (Accession NM_138551) is another VGAM2509 host target gene. TSLP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TSLP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSLP BINDING SITE, designated SEQ ID:28850, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85125] Another function of VGAM2509 is therefore inhibition of TSLP (Accession NM_138551), a gene which may contribute directly to the activation of Langerhans cells and

inhibit apoptosis. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSLP. The function of TSLP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558.Adaptor-related Protein Complex 4, Mu 1 Subunit (AP4M1, Accession NM_004722) is another VGAM2509 host target gene. AP4M1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AP4M1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP4M1 BINDING SITE, designated SEQ ID:11088, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85126] Another function of VGAM2509 is therefore inhibition of Adaptor-related Protein Complex 4, Mu 1 Subunit (AP4M1, Accession NM_004722). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP4M1. ATPase, (Na+)/K+ Transporting, Beta 4 Polypeptide

(ATP1B4, Accession NM_012069) is another VGAM2509 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14328, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85127] Another function of VGAM2509 is therefore inhibition of ATPase, (Na+)/K+ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670) is another VGAM2509 host target gene. BHLHB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BHLHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB2

BINDING SITE, designated SEQ ID:9756, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85128] Another function of VGAM2509 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB2. Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM_032625) is another VGAM2509 host target gene. C7orf13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C7orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf13 BINDING SITE, designated SEQ ID:26343, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85129] Another function of VGAM2509 is therefore inhibition of Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM_032625). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C7orf13. DCOHM (Accession NM_032151) is another VGAM2509 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25847, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85130] Another function of VGAM2509 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. DKFZp762A227 (Accession NM_014096) is another VGAM2509 host target gene. DKFZp762A227 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp762A227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE, designated SEQ

ID:15321, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85131] Another function of VGAM2509 is therefore inhibition of DKFZp762A227 (Accession NM_014096). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. Cyclin D Binding Myb-like Transcription Factor 1 (DMTF1, Accession NM_021145) is another VGAM2509 host target gene. DMTF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DMTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMTF1 BINDING SITE, designated SEQ ID:22117, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85132] Another function of VGAM2509 is therefore inhibition of Cyclin D Binding Myb-like Transcription Factor 1 (DMTF1, Accession NM_021145). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMTF1.

Extra Spindle Poles Like 1 (S. cerevisiae) (ESPL1, Accession NM_012291) is another VGAM2509 host target gene. ESPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ESPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPL1 BINDING SITE, designated SEQ ID:14631, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85133] Another function of VGAM2509 is therefore inhibition of Extra Spindle Poles Like 1 (S. cerevisiae) (ESPL1, Accession NM_012291). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPL1. FLJ00060 (Accession XM_028154) is another VGAM2509 host target gene. FLJ00060 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE, designated SEQ ID:30630, to the nucleotide sequence of VGAM2509 RNA,

herein designated VGAM RNA, also designated SEQ ID:5220.

[85134] Another function of VGAM2509 is therefore inhibition of FLJ00060 (Accession XM_028154). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. FLJ12484 (Accession XM_045681) is another VGAM2509 host target gene. FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2, designated SEQ ID:34517 and SEQ ID:23019 respectively, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85135] Another function of VGAM2509 is therefore inhibition of FLJ12484 (Accession XM_045681). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. FLJ12875 (Accession NM_024544) is another

VGAM2509 host target gene. FLJ12875 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12875 BINDING SITE, designated SEQ ID:23756, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85136] Another function of VGAM2509 is therefore inhibition of FLJ12875 (Accession NM_024544). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12875. FLJ12975 (Accession XM_045522) is another VGAM2509 host target gene. FLJ12975 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE, designated SEQ ID:34481, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85137] Another function of VGAM2509 is therefore inhibition of FLJ12975 (Accession XM_045522). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12975. FLJ13081 (Accession NM_024834) is another VGAM2509 host target gene. FLJ13081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13081 BINDING SITE, designated SEQ ID:24237, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85138] Another function of VGAM2509 is therefore inhibition of FLJ13081 (Accession NM_024834). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13081. HHGP (Accession NM_020200) is another VGAM2509 host target gene. HHGP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HHGP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHGP BINDING SITE, designated SEQ ID:21435, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85139] Another function of VGAM2509 is therefore inhibition of HHGP (Accession NM_020200). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHGP. KIAA1204 (Accession XM_045011) is another VGAM2509 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34317, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85140] Another function of VGAM2509 is therefore inhibition of KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1204. KIAA1463 (Accession XM_051160) is another VGAM2509 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35772, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85141] Another function of VGAM2509 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. KIAA1549 (Accession XM_045127) is another VGAM2509 host target gene. KIAA1549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1549 BINDING SITE, designated SEQ ID:34371, to the nucleotide sequence of VGAM2509 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5220.

[85142] Another function of VGAM2509 is therefore inhibition of KIAA1549 (Accession XM_045127). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1549. KIAA1576 (Accession XM_038186) is another VGAM2509 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32776, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85143] Another function of VGAM2509 is therefore inhibition of KIAA1576 (Accession XM_038186). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. KIAA1908 (Accession XM_055834) is another VGAM2509 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1908, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36341, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85144] Another function of VGAM2509 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. MGC22014 (Accession XM_035307) is another VGAM2509 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32221, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85145] Another function of VGAM2509 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC22014. MGC32043 (Accession NM_144582) is another VGAM2509 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:29393, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85146] Another function of VGAM2509 is therefore inhibition of MGC32043 (Accession NM_144582). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32043. Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178) is another VGAM2509 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE1 and

NPTXR BINDING SITE2, designated SEQ ID:27735 and SEQ ID:15587 respectively, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85147] Another function of VGAM2509 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. Smith-Magenis Syndrome Chromosome Region, Candidate 8 (SMCR8, Accession NM_144775) is another VGAM2509 host target gene. SMCR8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMCR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR8 BINDING SITE, designated SEQ ID:29567, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85148] Another function of VGAM2509 is therefore inhibition of Smith-Magenis Syndrome Chromosome Region, Candidate 8 (SMCR8, Accession NM_144775). Accordingly, utilities of

VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR8. LOC126302 (Accession XM_059020) is another VGAM2509 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36827, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85149] Another function of VGAM2509 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC126353 (Accession XM_059034) is another VGAM2509 host target gene. LOC126353 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC126353 BINDING SITE, designated SEQ ID:36831, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85150] Another function of VGAM2509 is therefore inhibition of LOC126353 (Accession XM_059034). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126353. LOC130535 (Accession XM_072244) is another VGAM2509 host target gene. LOC130535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130535 BINDING SITE, designated SEQ ID:37477, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85151] Another function of VGAM2509 is therefore inhibition of LOC130535 (Accession XM_072244). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130535. LOC144363 (Accession XM_084843) is another VGAM2509 host target gene. LOC144363 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144363 BINDING SITE, designated SEQ ID:37730, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85152] Another function of VGAM2509 is therefore inhibition of LOC144363 (Accession XM_084843). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144363. LOC146229 (Accession XM_085387) is another VGAM2509 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38113, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85153] Another function of VGAM2509 is therefore inhibition of

LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC147976 (Accession XM_085980) is another VGAM2509 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38430, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85154] Another function of VGAM2509 is therefore inhibition of LOC147976 (Accession XM_085980). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC150095 (Accession XM_097805) is another VGAM2509 host target gene. LOC150095 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC150095 BINDING SITE, designated SEQ ID:41132, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85155] Another function of VGAM2509 is therefore inhibition of LOC150095 (Accession XM_097805). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150095. LOC157753 (Accession XM_088381) is another VGAM2509 host target gene. LOC157753 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157753 BINDING SITE, designated SEQ ID:39663, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85156] Another function of VGAM2509 is therefore inhibition of LOC157753 (Accession XM_088381). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157753. LOC157858 (Accession XM_098833) is an-

other VGAM2509 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41870, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85157] Another function of VGAM2509 is therefore inhibition of LOC157858 (Accession XM_098833). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC163882 (Accession XM_089211) is another VGAM2509 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39974, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85158] Another function of VGAM2509 is therefore inhibition of LOC163882 (Accession XM_089211). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163882. LOC196205 (Accession XM_113676) is another VGAM2509 host target gene. LOC196205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196205 BINDING SITE, designated SEQ ID:42326, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85159] Another function of VGAM2509 is therefore inhibition of LOC196205 (Accession XM_113676). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196205. LOC200339 (Accession XM_117226) is another VGAM2509 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43300, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85160] Another function of VGAM2509 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC201245 (Accession XM_113326) is another VGAM2509 host target gene. LOC201245 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201245 BINDING SITE, designated SEQ ID:42231, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85161] Another function of VGAM2509 is therefore inhibition of LOC201245 (Accession XM_113326). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201245. LOC202934 (Accession XM_117486) is another VGAM2509 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43465, to the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, also designated SEQ ID:5220.

[85162] Another function of VGAM2509 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC255465 (Accession XM_173206) is another VGAM2509 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46457, to the nucleotide sequence of VGAM2509 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5220.

[85163] Another function of VGAM2509 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2510 (VGAM2510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85164] VGAM2510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2510 was detected is described hereinabove with reference to Figs. 1-8.

[85165] VGAM2510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85166] VGAM2510 gene encodes a VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2510 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2510 precursor RNA is designated SEQ ID:2496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2496 is located at position 226893 relative to the genome of Mouse Cytomegalovirus 1.

[85167] VGAM2510 precursor RNA folds onto itself, forming VGAM2510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85168] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2510 folded precursor RNA into VGAM2510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2510 RNA is designated SEQ ID:5221, and is provided hereinbelow with reference to the sequence listing part.

[85169] VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2510 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85170] VGAM2510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2510 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85171] The complementary binding of VGAM2510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2510 host target RNA into VGAM2510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85172] It is appreciated that VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2510 host target genes. The mRNA of

each one of this plurality of VGAM2510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2510 RNA, herein designated VGAM RNA, and which when bound by VGAM2510 RNA causes inhibition of translation of respective one or more VGAM2510 host target proteins.

[85173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2510 gene, herein designated VGAM GENE, on one or more VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[85174] It is yet further appreciated that a function of VGAM2510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2510 correlate with, and may be deduced from, the identity of the host target genes which VGAM2510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85175] Nucleotide sequences of the VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2510 are further described hereinbelow with reference to Table 1.

[85176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2510 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2510 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85177] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2510 gene, herein designated VGAM is inhibition of expression of VGAM2510 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2510 correlate with, and may be deduced from, the identity of the target genes which VGAM2510 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85178] Ephrin-B1 (EFNB1, Accession NM_004429) is a VGAM2510 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10704, to the nucleotide sequence of VGAM2510 RNA, herein designated VGAM RNA, also designated SEQ ID:5221.

[85179] A function of VGAM2510 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine

kinases, has a role in cell adhesion. Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390.Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 1, 50kDa (CSTF1, Accession NM_001324) is another VGAM2510 host target gene. CSTF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CSTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSTF1 BINDING SITE, designated SEQ ID:7008, to the nucleotide sequence of VGAM2510 RNA, herein designated VGAM RNA, also designated SEQ ID:5221.

[85180] Another function of VGAM2510 is therefore inhibition of Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 1, 50kDa (CSTF1, Accession NM_001324). Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSTF1. FLJ22794 (Accession XM_166220) is another VGAM2510

host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44022, to the nucleotide sequence of VGAM2510 RNA, herein designated VGAM RNA, also designated SEQ ID:5221.

[85181] Another function of VGAM2510 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA1977 (Accession XM_058800) is another VGAM2510 host target gene. KIAA1977 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:36744, to the nucleotide sequence of VGAM2510 RNA, herein designated VGAM RNA, also designated SEQ ID:5221.

[85182] Another function of VGAM2510 is therefore inhibition of KIAA1977 (Accession XM_058800). Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2511 (VGAM2511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85183] VGAM2511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2511 was detected is described hereinabove with reference to Figs. 1-8.

[85184] VGAM2511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85185] VGAM2511 gene encodes a VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2511 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2511 precursor RNA is designated SEQ ID:2497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2497 is located at position 36653 relative to the genome of Mouse Cytomegalovirus 1.

[85186] VGAM2511 precursor RNA folds onto itself, forming VGAM2511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85187] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2511 folded precursor RNA into VGAM2511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2511 RNA is designated SEQ ID:5222, and is provided hereinbelow with reference to the sequence listing part.

[85188] VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2511 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85189] VGAM2511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2511 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85190] The complementary binding of VGAM2511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2511 host target RNA into VGAM2511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85191] It is appreciated that VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2511 host target genes. The mRNA of each one of this plurality of VGAM2511 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2511 RNA, herein designated VGAM RNA, and which when bound by VGAM2511 RNA causes inhibition of translation of respective one or more VGAM2511 host target proteins.

[85192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2511 gene, herein designated VGAM GENE, on one or more VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85193] It is yet further appreciated that a function of VGAM2511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2511 correlate with, and may be deduced from, the identity of the host target genes which VGAM2511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85194] Nucleotide sequences of the VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2511 are further described hereinbelow with reference to Table 1.

[85195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2511 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2511 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[85196] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2511 gene, herein designated VGAM is inhibition of expression of VGAM2511 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2511 correlate with, and may be deduced from, the identity of the target genes which VGAM2511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85197] APACD (Accession NM_005783) is a VGAM2511 host target gene. APACD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APACD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APACD BINDING SITE, designated SEQ ID:12363, to the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, also designated SEQ ID:5222.

[85198] A function of VGAM2511 is therefore inhibition of APACD (Accession NM_005783). Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APACD.

COP9 Constitutive Photomorphogenic Homolog Subunit 7A (Arabidopsis) (COPS7A, Accession NM_016319) is another VGAM2511 host target gene. COPS7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COPS7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7A BINDING SITE, designated SEQ ID:18437, to the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, also designated SEQ ID:5222.

[85199] Another function of VGAM2511 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7A (Arabidopsis) (COPS7A, Accession NM_016319). Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7A. FLJ10702 (Accession NM_018184) is another VGAM2511 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ10702 BINDING SITE, designated SEQ ID:20028, to the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, also designated SEQ ID:5222.

[85200] Another function of VGAM2511 is therefore inhibition of FLJ10702 (Accession NM_018184). Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. Sphingomyelin Phosphodiesterase 2, Neutral Membrane (neutral sphingomyelinase) (SMPD2, Accession NM_003080) is another VGAM2511 host target gene. SMPD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMPD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMPD2 BINDING SITE, designated SEQ ID:9053, to the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, also designated SEQ ID:5222.

[85201] Another function of VGAM2511 is therefore inhibition of Sphingomyelin Phosphodiesterase 2, Neutral Membrane (neutral sphingomyelinase) (SMPD2, Accession

NM_003080). Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMPD2. LOC254251 (Accession XM_171088) is another VGAM2511 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45898, to the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, also designated SEQ ID:5222.

[85202] Another function of VGAM2511 is therefore inhibition of LOC254251 (Accession XM_171088). Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2512 (VGAM2512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[85203] VGAM2512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2512 was detected is described hereinabove with reference to Figs. 1-8.

[85204] VGAM2512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85205] VGAM2512 gene encodes a VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2512 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2512 precursor RNA is designated SEQ ID:2498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2498 is located at position 84643 relative to the genome of Mouse Cytomegalovirus 1.

[85206] VGAM2512 precursor RNA folds onto itself, forming VGAM2512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85207] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2512 folded precursor RNA into VGAM2512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2512 RNA is designated SEQ ID:5223, and is provided hereinbelow with reference to the sequence listing part.

[85208] VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2512 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85209] VGAM2512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2512 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2512 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[85210] The complementary binding of VGAM2512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2512 host target RNA into VGAM2512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85211] It is appreciated that VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2512 host target genes. The mRNA of each one of this plurality of VGAM2512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2512 RNA, herein designated VGAM RNA, and which when bound by VGAM2512 RNA causes inhibition of translation of respective one or more VGAM2512 host target proteins.

[85212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2512 gene, herein designated VGAM GENE, on one

or more VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85213] It is yet further appreciated that a function of VGAM2512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2512 correlate with, and may be deduced from, the identity of the host target genes which VGAM2512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85214] Nucleotide sequences of the VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2512 are further described hereinbelow with reference to Table 1.

[85215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2512 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85216] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2512 gene, herein designated VGAM is inhibition of expression of VGAM2512 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2512 correlate with, and may be deduced from, the identity of the target genes which VGAM2512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85217] ATPase, Aminophospholipid Transporter-like, Class I,

Type 8A, Member 2 (ATP8A2, Accession XM_167916) is a VGAM2512 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44914, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85218] A function of VGAM2512 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM_007068) is another VGAM2512 host target gene. DMC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DMC1 BINDING SITE, designated SEQ ID:13932, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85219] Another function of VGAM2512 is therefore inhibition of DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM_007068). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMC1. Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM_000844) is another VGAM2512 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:6515, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85220] Another function of VGAM2512 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM_000844), a gene which is mediated by a g-protein

that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7. The function of GRM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746.Potassium Inwardly-rectifying Channel, Subfamily J, Member 1 (KCNJ1, Accession NM_000220) is another VGAM2512 host target gene. KCNJ1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ1 BINDING SITE, designated SEQ ID:5728, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85221] Another function of VGAM2512 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 1 (KCNJ1, Accession NM_000220). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ1. Solute Carrier Family 11 (proton-coupled di-

valent metal ion transporters), Member 3 (SLC11A3, Accession NM_014585) is another VGAM2512 host target gene. SLC11A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC11A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A3 BINDING SITE, designated SEQ ID:15941, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85222] Another function of VGAM2512 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 3 (SLC11A3, Accession NM_014585). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A3. DKFZP586F1318 (Accession NM_015677) is another VGAM2512 host target gene. DKFZP586F1318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586F1318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZP586F1318 BINDING SITE, designated SEQ ID:17903, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85223] Another function of VGAM2512 is therefore inhibition of DKFZP586F1318 (Accession NM_015677). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1318. DKFZp761N1114 (Accession XM_086327) is another VGAM2512 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38607, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85224] Another function of VGAM2512 is therefore inhibition of DKFZp761N1114 (Accession XM_086327). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761N1114. FLJ32784 (Accession NM_144623) is another VGAM2512 host target gene. FLJ32784 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32784 BINDING SITE, designated SEQ ID:29442, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85225] Another function of VGAM2512 is therefore inhibition of FLJ32784 (Accession NM_144623). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32784. INSM2 (Accession NM_032594) is another VGAM2512 host target gene. INSM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INSM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSM2 BINDING SITE, designated SEQ ID:26327, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5223.

[85226] Another function of VGAM2512 is therefore inhibition of INSM2 (Accession NM_032594). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSM2. KIAA0332 (Accession XM_031553) is another VGAM2512 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31420, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85227] Another function of VGAM2512 is therefore inhibition of KIAA0332 (Accession XM_031553). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA0376 (Accession XM_037759) is another VGAM2512 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0376, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32671, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85228] Another function of VGAM2512 is therefore inhibition of KIAA0376 (Accession XM_037759). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. KIAA0788 (Accession XM_049108) is another VGAM2512 host target gene. KIAA0788 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0788 BINDING SITE, designated SEQ ID:35343, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85229] Another function of VGAM2512 is therefore inhibition of KIAA0788 (Accession XM_049108). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0788. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_138727) is another VGAM2512 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:28978, SEQ ID:29208 and SEQ ID:19336 respectively, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85230] Another function of VGAM2512 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_138727). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM2512 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34292, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85231] Another function of VGAM2512 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. Succinate-CoA Ligase, GDP-forming, Beta Subunit (SUCLG2, Accession XM_037772) is another VGAM2512 host target gene. SUCLG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUCLG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUCLG2 BINDING SITE, designated SEQ ID:32677, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85232] Another function of VGAM2512 is therefore inhibition of Succinate-CoA Ligase, GDP-forming, Beta Subunit

(SUCLG2, Accession XM_037772). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUCLG2. Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM2512 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17602, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85233] Another function of VGAM2512 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC149506 (Accession XM_097661) is another VGAM2512 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:40999, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85234] Another function of VGAM2512 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC153914 (Accession XM_087799) is another VGAM2512 host target gene. LOC153914 BINDING SITE1 and LOC153914 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC153914, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153914 BINDING SITE1 and LOC153914 BINDING SITE2, designated SEQ ID:39437 and SEQ ID:39435 respectively, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85235] Another function of VGAM2512 is therefore inhibition of

LOC153914 (Accession XM_087799). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153914. LOC222031 (Accession XM_168371) is another VGAM2512 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45129, to the nucleotide sequence of VGAM2512 RNA, herein designated VGAM RNA, also designated SEQ ID:5223.

[85236] Another function of VGAM2512 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2513 (VGAM2513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[85237] VGAM2513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2513 was detected is described hereinabove with reference to Figs. 1-8.

[85238] VGAM2513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85239] VGAM2513 gene encodes a VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2513 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2513 precursor RNA is designated SEQ ID:2499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2499 is located at position 157900 relative to the genome of Mouse Cytomegalovirus 1.

[85240] VGAM2513 precursor RNA folds onto itself, forming VGAM2513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2513 folded precursor RNA into VGAM2513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2513 RNA is designated SEQ ID:5224, and is provided hereinbelow with reference to the sequence listing part.

[85242] VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2513 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85243] VGAM2513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2513 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[85244] The complementary binding of VGAM2513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2513 host target RNA into VGAM2513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85245] It is appreciated that VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2513 host target genes. The mRNA of each one of this plurality of VGAM2513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2513 RNA, herein designated VGAM RNA, and which when bound by VGAM2513 RNA causes inhibition of translation of respective one or more VGAM2513 host target proteins.

[85246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2513 gene, herein designated VGAM GENE, on one

or more VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85247] It is yet further appreciated that a function of VGAM2513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2513 correlate with, and may be deduced from, the identity of the host target genes which VGAM2513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85248] Nucleotide sequences of the VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2513 are further described hereinbelow with reference to Table 1.

[85249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2513 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2513 gene, herein designated VGAM is inhibition of expression of VGAM2513 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2513 correlate with, and may be deduced from, the identity of the target genes which VGAM2513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85251] Stromal Interaction Molecule 1 (STIM1, Accession

XM_011967) is a VGAM2513 host target gene. STIM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM1 BINDING SITE, designated SEQ ID:30202, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85252] A function of VGAM2513 is therefore inhibition of Stromal Interaction Molecule 1 (STIM1, Accession XM_011967), a gene which is very strongly similar to murine Stim1 and may be a transmembrane stromal cell protein. Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIM1. The function of STIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1191.CAT56 (Accession NM_025263) is another VGAM2513 host target gene. CAT56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAT56, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT56 BINDING SITE, designated SEQ ID:24930, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85253] Another function of VGAM2513 is therefore inhibition of CAT56 (Accession NM_025263). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT56. FLJ23598 (Accession NM_024783) is another VGAM2513 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24155, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85254] Another function of VGAM2513 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23598. FLJ32332 (Accession NM_144641) is another VGAM2513 host target gene. FLJ32332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32332 BINDING SITE, designated SEQ ID:29469, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85255] Another function of VGAM2513 is therefore inhibition of FLJ32332 (Accession NM_144641). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32332. KIAA0022 (Accession NM_014880) is another VGAM2513 host target gene. KIAA0022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0022 BINDING SITE, designated SEQ ID:17029, to the

nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85256] Another function of VGAM2513 is therefore inhibition of KIAA0022 (Accession NM_014880). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0022. KIAA1211 (Accession XM_044178) is another VGAM2513 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34162, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85257] Another function of VGAM2513 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1522 (Accession XM_036299) is another VGAM2513 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32414, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85258] Another function of VGAM2513 is therefore inhibition of KIAA1522 (Accession XM_036299). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. KIAA1866 (Accession XM_027658) is another VGAM2513 host target gene. KIAA1866 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:30552, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85259] Another function of VGAM2513 is therefore inhibition of KIAA1866 (Accession XM_027658). Accordingly, utilities

of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another VGAM2513 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33350, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85260] Another function of VGAM2513 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM2513 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34876, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85261] Another function of VGAM2513 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. Transient Receptor Potential Cation Channel, Subfamily V, Member 5 (TRPV5, Accession NM_019841) is another VGAM2513 host target gene. TRPV5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPV5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV5 BINDING SITE, designated SEQ ID:21247, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85262] Another function of VGAM2513 is therefore inhibition of

Transient Receptor Potential Cation Channel, Subfamily V, Member 5 (TRPV5, Accession NM_019841). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV5. LOC219397 (Accession XM_167889) is another VGAM2513 host target gene. LOC219397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219397 BINDING SITE, designated SEQ ID:44897, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85263] Another function of VGAM2513 is therefore inhibition of LOC219397 (Accession XM_167889). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219397. LOC221322 (Accession XM_166323) is another VGAM2513 host target gene. LOC221322 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221322, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221322 BINDING SITE, designated SEQ ID:44151, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85264] Another function of VGAM2513 is therefore inhibition of LOC221322 (Accession XM_166323). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221322. LOC222060 (Accession XM_168427) is another VGAM2513 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45158, to the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, also designated SEQ ID:5224.

[85265] Another function of VGAM2513 is therefore inhibition of LOC222060 (Accession XM_168427). Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222060. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2514 (VGAM2514) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85266] VGAM2514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2514 was detected is described hereinabove with reference to Figs. 1-8.

[85267] VGAM2514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85268] VGAM2514 gene encodes a VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2514 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2514 precursor RNA is designated SEQ ID:2500, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2500 is located at position 127106 relative to the genome of Mouse Cytomegalovirus 1.

[85269] VGAM2514 precursor RNA folds onto itself, forming VGAM2514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85270] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2514 folded precursor RNA into VGAM2514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2514 RNA is designated SEQ ID:5225, and is provided hereinbelow with reference to the sequence listing part.

[85271] VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2514 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85272] VGAM2514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2514 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85273] The complementary binding of VGAM2514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2514 host target RNA into VGAM2514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85274] It is appreciated that VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2514 host target genes. The mRNA of each one of this plurality of VGAM2514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2514 RNA, herein designated VGAM RNA, and which when bound by VGAM2514 RNA causes

inhibition of translation of respective one or more VGAM2514 host target proteins.

[85275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2514 gene, herein designated VGAM GENE, on one or more VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85276] It is yet further appreciated that a function of VGAM2514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2514 include diagnosis, prevention and

treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2514 correlate with, and may be deduced from, the identity of the host target genes which VGAM2514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85277] Nucleotide sequences of the VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2514 are further described hereinbelow with reference to Table 1.

[85278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2514 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85279] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2514 gene, herein designated VGAM is inhibition of expression of VGAM2514 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2514 correlate with, and may be deduced from, the identity of the target genes which VGAM2514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85280] Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is a VGAM2514 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7332, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85281] A function of VGAM2514 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM368.Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession NM_022336) is another VGAM2514 host target gene. EDAR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EDAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDAR BINDING SITE, designated SEQ ID:22745, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85282] Another function of VGAM2514 is therefore inhibition of Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession NM_022336). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDAR. Fibulin 5 (FBLN5, Accession NM_006329) is another VGAM2514 host target gene. FBLN5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FBLN5 BINDING SITE, designated SEQ ID:13026, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85283] Another function of VGAM2514 is therefore inhibition of Fibulin 5 (FBLN5, Accession NM_006329), a gene which promotes adhesion of endothelial cells through interaction of integrins and the rgd motif. Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN5. The function of FBLN5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1127.Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990) is another VGAM2514 host target gene. GABRE BINDING SITE1 through GABRE BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABRE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE1 through GABRE BINDING SITE4, designated SEQ ID:22528, SEQ ID:22513, SEQ

ID:22509 and SEQ ID:11407 respectively, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85284] Another function of VGAM2514 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Nephronophthisis 1 (juvenile) (NPHP1, Accession XM_031236) is another VGAM2514 host target gene. NPHP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPHP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPHP1 BINDING SITE, designated SEQ ID:31315, to the nucleotide sequence of VGAM2514 RNA,

herein designated VGAM RNA, also designated SEQ ID:5225.

[85285] Another function of VGAM2514 is therefore inhibition of Nephronophthisis 1 (juvenile) (NPHP1, Accession XM_031236). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPHP1. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695) is another VGAM2514 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35477, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85286] Another function of VGAM2514 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.CHFR (Accession NM_018223) is another VGAM2514 host target gene. CHFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHFR BINDING SITE, designated SEQ ID:20149, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85287] Another function of VGAM2514 is therefore inhibition of CHFR (Accession NM_018223). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHFR. DKFZp586I021 (Accession NM_032271) is another VGAM2514 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26020, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85288] Another function of VGAM2514 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. DKFZP761I2123 (Accession NM_031449) is another VGAM2514 host target gene. DKFZP761I2123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761I2123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761I2123 BINDING SITE, designated SEQ ID:25463, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85289] Another function of VGAM2514 is therefore inhibition of DKFZP761I2123 (Accession NM_031449). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP761I2123. FLJ14855 (Accession NM_033210) is another VGAM2514 host target gene. FLJ14855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14855 BINDING SITE, designated SEQ ID:27060, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85290] Another function of VGAM2514 is therefore inhibition of FLJ14855 (Accession NM_033210). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14855. FLJ20069 (Accession NM_017651) is another VGAM2514 host target gene. FLJ20069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20069 BINDING SITE, designated SEQ ID:19157, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM

RNA, also designated SEQ ID:5225.

[85291] Another function of VGAM2514 is therefore inhibition of FLJ20069 (Accession NM_017651). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20069. FLJ21140 (Accession NM_024776) is another VGAM2514 host target gene. FLJ21140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21140 BINDING SITE, designated SEQ ID:24140, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85292] Another function of VGAM2514 is therefore inhibition of FLJ21140 (Accession NM_024776). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21140. PNPASE (Accession XM_048088) is another VGAM2514 host target gene. PNPASE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PNPASE, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:35101, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85293] Another function of VGAM2514 is therefore inhibition of PNPASE (Accession XM_048088). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. PRO1914 (Accession NM_014106) is another VGAM2514 host target gene. PRO1914 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1914 BINDING SITE, designated SEQ ID:15328, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85294] Another function of VGAM2514 is therefore inhibition of PRO1914 (Accession NM_014106). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO1914. TERA (Accession NM_021238) is another VGAM2514 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:22206, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85295] Another function of VGAM2514 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. LOC196283 (Accession XM_113684) is another VGAM2514 host target gene. LOC196283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196283 BINDING SITE, designated SEQ ID:42340, to

the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85296] Another function of VGAM2514 is therefore inhibition of LOC196283 (Accession XM_113684). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196283. LOC202451 (Accession XM_117401) is another VGAM2514 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43436, to the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, also designated SEQ ID:5225.

[85297] Another function of VGAM2514 is therefore inhibition of LOC202451 (Accession XM_117401). Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2515 (VGAM2515) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85298] VGAM2515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2515 was detected is described hereinabove with reference to Figs. 1-8.

[85299] VGAM2515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85300] VGAM2515 gene encodes a VGAM2515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2515 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2515 precursor RNA is designated SEQ ID:2501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2501 is located at position 35144 relative to the genome of Mouse Cytomegalovirus 1.

[85301] VGAM2515 precursor RNA folds onto itself, forming VGAM2515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85302] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2515 folded precursor RNA into VGAM2515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2515 RNA is designated SEQ ID:5226, and is provided hereinbelow with reference to the sequence listing part.

[85303] VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2515 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2515 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85304] VGAM2515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2515 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85305] The complementary binding of VGAM2515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2515 host target RNA into VGAM2515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85306] It is appreciated that VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2515 host target genes. The mRNA of each one of this plurality of VGAM2515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2515 RNA, herein designated VGAM RNA, and which when bound by VGAM2515 RNA causes inhibition of translation of respective one or more VGAM2515 host target proteins.

[85307] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2515 gene, herein designated VGAM GENE, on one or more VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85308] It is yet further appreciated that a function of VGAM2515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2515 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85309] Nucleotide sequences of the VGAM2515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2515 are further described hereinbelow with reference to Table 1.

[85310] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2515 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85311] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2515 gene, herein designated VGAM is inhibition of expression of VGAM2515 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2515 correlate with, and may be deduced from, the identity of the target genes which VGAM2515

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85312] Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827) is a VGAM2515 host target gene. PTPN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN1 BINDING SITE, designated SEQ ID:8703, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85313] A function of VGAM2515 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827), a gene which is a non-receptor type 1 protein tyrosine phosphatase and inhibits insulin signaling. Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN1. The function of PTPN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM327.Zinc Fin-

ger Protein 2 (A1-5) (ZNF2, Accession NM_021088) is another VGAM2515 host target gene. ZNF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF2 BINDING SITE, designated SEQ ID:22070, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85314] Another function of VGAM2515 is therefore inhibition of Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF2. D2S448 (Accession XM_056455) is another VGAM2515 host target gene. D2S448 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by D2S448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D2S448 BINDING SITE, designated SEQ ID:36396, to the nucleotide sequence of VGAM2515 RNA,

herein designated VGAM RNA, also designated SEQ ID:5226.

[85315] Another function of VGAM2515 is therefore inhibition of D2S448 (Accession XM_056455). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D2S448. FLJ13102 (Accession NM_024887) is another VGAM2515 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24345, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85316] Another function of VGAM2515 is therefore inhibition of FLJ13102 (Accession NM_024887). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. KIAA0418 (Accession NM_014631) is another VGAM2515 host target gene. KIAA0418 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0418 BINDING SITE, designated SEQ ID:15998, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85317] Another function of VGAM2515 is therefore inhibition of KIAA0418 (Accession NM_014631). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0418. MAGE-E1 (Accession NM_030801) is another VGAM2515 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25107, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85318] Another function of VGAM2515 is therefore inhibition of MAGE-E1 (Accession NM_030801). Accordingly, utilities of

VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. Melanoma Antigen, Family E, 1, Cancer/testis Specific (MAGEE1, Accession NM_016249) is another VGAM2515 host target gene. MAGEE1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAGEE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEE1 BINDING SITE, designated SEQ ID:18377, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85319] Another function of VGAM2515 is therefore inhibition of Melanoma Antigen, Family E, 1, Cancer/testis Specific (MAGEE1, Accession NM_016249). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEE1. Mesoderm Development Candidate 1 (MESDC1, Accession NM_022566) is another VGAM2515 host target gene. MESDC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MESDC1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC1 BINDING SITE, designated SEQ ID:22884, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85320] Another function of VGAM2515 is therefore inhibition of Mesoderm Development Candidate 1 (MESDC1, Accession NM_022566). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC1. MGC11335 (Accession NM_030819) is another VGAM2515 host target gene. MGC11335 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11335 BINDING SITE, designated SEQ ID:25148, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85321] Another function of VGAM2515 is therefore inhibition of MGC11335 (Accession NM_030819). Accordingly, utilities

of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11335. OS4 (Accession NM_005730) is another VGAM2515 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:12291, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85322] Another function of VGAM2515 is therefore inhibition of OS4 (Accession NM_005730). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4. PP1665 (Accession NM_030792) is another VGAM2515 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, des-

ignated SEQ ID:25092, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85323] Another function of VGAM2515 is therefore inhibition of PP1665 (Accession NM_030792). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2515 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30778, to the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, also designated SEQ ID:5226.

[85324] Another function of VGAM2515 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PPP1R16B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2516 (VGAM2516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85325] VGAM2516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2516 was detected is described hereinabove with reference to Figs. 1-8.

[85326] VGAM2516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85327] VGAM2516 gene encodes a VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2516 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2516 precursor RNA is designated SEQ ID:2502, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2502 is located at position 84255 relative to the genome of Mouse Cytomegalovirus 1.

[85328] VGAM2516 precursor RNA folds onto itself, forming VGAM2516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85329] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2516 folded precursor RNA into VGAM2516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2516 RNA is designated SEQ ID:5227, and is provided hereinbelow with reference to the sequence listing part.

[85330] VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2516 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85331] VGAM2516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2516 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85332] The complementary binding of VGAM2516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2516 host target RNA into VGAM2516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85333] It is appreciated that VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2516 host target genes. The mRNA of each one of this plurality of VGAM2516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2516 RNA, herein designated VGAM RNA, and which when bound by VGAM2516 RNA causes

inhibition of translation of respective one or more VGAM2516 host target proteins.

[85334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2516 gene, herein designated VGAM GENE, on one or more VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85335] It is yet further appreciated that a function of VGAM2516 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2516 include diagnosis, prevention and

treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2516 correlate with, and may be deduced from, the identity of the host target genes which VGAM2516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85336] Nucleotide sequences of the VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2516 are further described hereinbelow with reference to Table 1.

[85337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2516 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85338] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2516 gene, herein designated VGAM is inhibition of expression of VGAM2516 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2516 correlate with, and may be deduced from, the identity of the target genes which VGAM2516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85339] FLJ14442 (Accession NM_032785) is a VGAM2516 host target gene. FLJ14442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:26534, to the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, also designated SEQ ID:5227.

[85340] A function of VGAM2516 is therefore inhibition of FLJ14442 (Accession NM_032785). Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442. ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951) is another VGAM2516 host target gene. ISL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by ISL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISL2 BINDING SITE, designated SEQ ID:35081, to the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, also designated SEQ ID:5227.

[85341] Another function of VGAM2516 is therefore inhibition of ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951). Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL2. KIAA1915 (Accession XM_055481) is another VGAM2516 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36273, to the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, also designated SEQ ID:5227.

[85342] Another function of VGAM2516 is therefore inhibition of

KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1915. PLPL (Accession NM_020181) is another VGAM2516 host target gene. PLPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLPL BINDING SITE, designated SEQ ID:21400, to the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, also designated SEQ ID:5227.

[85343] Another function of VGAM2516 is therefore inhibition of PLPL (Accession NM_020181). Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLPL. LOC256639 (Accession XM_171241) is another VGAM2516 host target gene. LOC256639 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC256639 BINDING SITE, designated SEQ ID:46029, to the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, also designated SEQ ID:5227.

[85344] Another function of VGAM2516 is therefore inhibition of LOC256639 (Accession XM_171241). Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2517 (VGAM2517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85345] VGAM2517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2517 was detected is described hereinabove with reference to Figs. 1-8.

[85346] VGAM2517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[85347] VGAM2517 gene encodes a VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2517 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2517 precursor RNA is designated SEQ ID:2503, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2503 is located at position 158132 relative to the genome of Mouse Cytomegalovirus 1.

[85348] VGAM2517 precursor RNA folds onto itself, forming VGAM2517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85349] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2517 folded precursor RNA into VGAM2517 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2517 RNA is designated SEQ ID:5228, and is provided hereinbelow with reference to the sequence listing part.

[85350] VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2517 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85351] VGAM2517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2517 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85352] The complementary binding of VGAM2517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2517 host target RNA into VGAM2517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85353] It is appreciated that VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2517 host target genes. The mRNA of each one of this plurality of VGAM2517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2517 RNA, herein designated VGAM RNA, and which when bound by VGAM2517 RNA causes inhibition of translation of respective one or more VGAM2517 host target proteins.

[85354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2517 gene, herein designated VGAM GENE, on one or more VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85355] It is yet further appreciated that a function of VGAM2517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2517 correlate with, and may be deduced from, the identity of the host target genes which VGAM2517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85356] Nucleotide sequences of the VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2517 are further described hereinbelow with reference to Table 1.

[85357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2517 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85358] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2517 gene, herein designated VGAM is inhibition of expression of VGAM2517 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2517 correlate with, and may be deduced from, the identity of the target genes which VGAM2517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85359] Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM_001736) is a VGAM2517 host target gene. C5R1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5R1 BINDING SITE, designated SEQ ID:7472, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85360] A function of VGAM2517 is therefore inhibition of Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM_001736), a gene which has a nonredundant function and is required for mucosal host cell defense in the lung. Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5R1. The function of C5R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM484.Phosphoenolpyruvate Carboxykinase 1 (soluble) (PCK1, Accession XM_009672) is another VGAM2517 host target gene. PCK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCK1 BINDING SITE, designated SEQ ID:30117, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85361] Another function of VGAM2517 is therefore inhibition of Phosphoenolpyruvate Carboxykinase 1 (soluble) (PCK1,

Accession XM_009672), a gene which forms phosphoenolpyruvate by decarboxylation of oxaloacetate. Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCK1. The function of PCK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2341.HERV-H LTR-associating 2 (HHLA2, Accession NM_007072) is another VGAM2517 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13936, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85362] Another function of VGAM2517 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM_007072). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. KIAA1559

(Accession XM_054472) is another VGAM2517 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36161, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85363] Another function of VGAM2517 is therefore inhibition of KIAA1559 (Accession XM_054472). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943) is another VGAM2517 host target gene. RASGRF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASGRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRF2 BINDING SITE, designated SEQ ID:30598, to the nucleotide

sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85364] Another function of VGAM2517 is therefore inhibition of Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRF2. LOC124460 (Accession XM_071892) is another VGAM2517 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37443, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85365] Another function of VGAM2517 is therefore inhibition of LOC124460 (Accession XM_071892). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC147817 (Accession XM_085903) is another VGAM2517 host target gene. LOC147817 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38383, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85366] Another function of VGAM2517 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC164397 (Accession XM_092780) is another VGAM2517 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40152, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85367] Another function of VGAM2517 is therefore inhibition of

LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC201294 (Accession XM_113950) is another VGAM2517 host target gene. LOC201294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201294 BINDING SITE, designated SEQ ID:42566, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85368] Another function of VGAM2517 is therefore inhibition of LOC201294 (Accession XM_113950). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201294. LOC245728 (Accession XM_165922) is another VGAM2517 host target gene. LOC245728 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC245728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC245728 BINDING SITE, designated SEQ ID:43801, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85369] Another function of VGAM2517 is therefore inhibition of LOC245728 (Accession XM_165922). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245728. LOC253038 (Accession XM_174524) is another VGAM2517 host target gene. LOC253038 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253038 BINDING SITE, designated SEQ ID:46595, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85370] Another function of VGAM2517 is therefore inhibition of LOC253038 (Accession XM_174524). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253038. LOC253776 (Accession XM_173240) is an-

other VGAM2517 host target gene. LOC253776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253776 BINDING SITE, designated SEQ ID:46525, to the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, also designated SEQ ID:5228.

[85371] Another function of VGAM2517 is therefore inhibition of LOC253776 (Accession XM_173240). Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253776. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2518 (VGAM2518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85372] VGAM2518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2518 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[85373] VGAM2518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85374] VGAM2518 gene encodes a VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2518 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2518 precursor RNA is designated SEQ ID:2504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2504 is located at position 3872 relative to the genome of Mouse Cytomegalovirus 1.

[85375] VGAM2518 precursor RNA folds onto itself, forming VGAM2518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85376] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2518 folded precursor RNA into VGAM2518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2518 RNA is designated SEQ ID:5229, and is provided hereinbelow with reference to the sequence listing part.

[85377] VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2518 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85378] VGAM2518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2518 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85379] The complementary binding of VGAM2518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2518 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2518 host target RNA into VGAM2518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85380] It is appreciated that VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2518 host target genes. The mRNA of each one of this plurality of VGAM2518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2518 RNA, herein designated VGAM RNA, and which when bound by VGAM2518 RNA causes inhibition of translation of respective one or more VGAM2518 host target proteins.

[85381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2518 gene, herein designated VGAM GENE, on one or more VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85382] It is yet further appreciated that a function of VGAM2518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2518 correlate with, and may be deduced from, the identity of the host target genes which VGAM2518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85383] Nucleotide sequences of the VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2518 are further described hereinbelow with reference to Table 1.

[85384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2518 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2518 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85385] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2518 gene, herein designated VGAM is inhibition of expression of VGAM2518 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2518 correlate with, and may be deduced from, the identity of the target genes which VGAM2518 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85386] Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216) is a VGAM2518 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:5718, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85387] A function of VGAM2518 is therefore inhibition of Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693) is another VGAM2518 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:19251, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85388] Another function of VGAM2518 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693). Accordingly, utilities of

VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. BOP (Accession XM_097915) is another VGAM2518 host target gene. BOP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:41208, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85389] Another function of VGAM2518 is therefore inhibition of BOP (Accession XM_097915). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP. KIAA1458 (Accession XM_044434) is another VGAM2518 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE,

designated SEQ ID:34207, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85390] Another function of VGAM2518 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. KIAA1829 (Accession XM_030378) is another VGAM2518 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31035, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85391] Another function of VGAM2518 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. MGC11082 (Accession NM_032691) is another VGAM2518 host target gene. MGC11082 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11082 BINDING SITE, designated SEQ ID:26412, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85392] Another function of VGAM2518 is therefore inhibition of MGC11082 (Accession NM_032691). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11082. MGC4663 (Accession NM_024514) is another VGAM2518 host target gene. MGC4663 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4663 BINDING SITE, designated SEQ ID:23718, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85393] Another function of VGAM2518 is therefore inhibition of

MGC4663 (Accession NM_024514). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4663. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644) is another VGAM2518 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:16050, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85394] Another function of VGAM2518 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. LOC120227 (Accession XM_058459) is another VGAM2518 host target gene. LOC120227 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120227, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120227 BINDING SITE, designated SEQ ID:36620, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85395] Another function of VGAM2518 is therefore inhibition of LOC120227 (Accession XM_058459). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120227. LOC158318 (Accession XM_098925) is another VGAM2518 host target gene. LOC158318 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158318 BINDING SITE, designated SEQ ID:41957, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85396] Another function of VGAM2518 is therefore inhibition of LOC158318 (Accession XM_098925). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158318. LOC158857 (Accession XM_098997) is another VGAM2518 host target gene. LOC158857 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158857, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158857 BINDING SITE, designated SEQ ID:42031, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85397] Another function of VGAM2518 is therefore inhibition of LOC158857 (Accession XM_098997). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158857. LOC159049 (Accession XM_099020) is another VGAM2518 host target gene. LOC159049 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159049, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159049 BINDING SITE, designated SEQ ID:42057, to

the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85398] Another function of VGAM2518 is therefore inhibition of LOC159049 (Accession XM_099020). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159049. LOC200310 (Accession XM_037840) is another VGAM2518 host target gene. LOC200310 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200310 BINDING SITE, designated SEQ ID:32710, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85399] Another function of VGAM2518 is therefore inhibition of LOC200310 (Accession XM_037840). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200310. LOC257443 (Accession XM_171072) is another VGAM2518 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257443 BINDING SITE, designated SEQ ID:45875, to the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, also designated SEQ ID:5229.

[85400] Another function of VGAM2518 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257443. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2519 (VGAM2519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85401] VGAM2519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2519 was detected is described hereinabove with reference to Figs. 1-8.

[85402] VGAM2519 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85403] VGAM2519 gene encodes a VGAM2519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2519 precursor RNA is designated SEQ ID:2505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2505 is located at position 59910 relative to the genome of Mouse Cytomegalovirus 1.

[85404] VGAM2519 precursor RNA folds onto itself, forming VGAM2519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2519 folded precursor RNA into VGAM2519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2519 RNA is designated SEQ ID:5230, and is provided hereinbelow with reference to the sequence listing part.

[85406] VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2519 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85407] VGAM2519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2519 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85408] The complementary binding of VGAM2519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2519

host target RNA into VGAM2519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85409] It is appreciated that VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2519 host target genes. The mRNA of each one of this plurality of VGAM2519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2519 RNA, herein designated VGAM RNA, and which when bound by VGAM2519 RNA causes inhibition of translation of respective one or more VGAM2519 host target proteins.

[85410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2519 gene, herein designated VGAM GENE, on one or more VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85411] It is yet further appreciated that a function of VGAM2519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2519 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2519 correlate with, and may be deduced from, the identity of the host target genes which VGAM2519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85412] Nucleotide sequences of the VGAM2519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2519 are further

described hereinbelow with reference to Table 1.

[85413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2519 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2519 gene, herein designated VGAM is inhibition of expression of VGAM2519 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2519 correlate with, and may be deduced from, the identity of the target genes which VGAM2519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85415] KIAA0356 (Accession XM_038655) is a VGAM2519 host target gene. KIAA0356 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0356 BINDING SITE,

designated SEQ ID:32892, to the nucleotide sequence of VGAM2519 RNA, herein designated VGAM RNA, also designated SEQ ID:5230.

[85416] A function of VGAM2519 is therefore inhibition of KIAA0356 (Accession XM_038655). Accordingly, utilities of VGAM2519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0356. LOC150295 (Accession XM_097868) is another VGAM2519 host target gene. LOC150295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150295 BINDING SITE, designated SEQ ID:41178, to the nucleotide sequence of VGAM2519 RNA, herein designated VGAM RNA, also designated SEQ ID:5230.

[85417] Another function of VGAM2519 is therefore inhibition of LOC150295 (Accession XM_097868). Accordingly, utilities of VGAM2519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150295. LOC219513 (Accession XM_169166) is another VGAM2519 host target gene. LOC219513 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45292, to the nucleotide sequence of VGAM2519 RNA, herein designated VGAM RNA, also designated SEQ ID:5230.

[85418] Another function of VGAM2519 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM2519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2520 (VGAM2520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85419] VGAM2520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2520 was detected is described hereinabove with reference to Figs. 1-8.

[85420] VGAM2520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85421] VGAM2520 gene encodes a VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2520 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2520 precursor RNA is designated SEQ ID:2506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2506 is located at position 173931 relative to the genome of Mouse Cytomegalovirus 1.

[85422] VGAM2520 precursor RNA folds onto itself, forming VGAM2520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[85423] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2520 folded precursor RNA into VGAM2520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2520 RNA is designated SEQ ID:5231, and is provided hereinbelow with reference to the sequence listing part.

[85424] VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2520 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85425] VGAM2520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2520 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2520 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85426] The complementary binding of VGAM2520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2520 host target RNA into VGAM2520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85427] It is appreciated that VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2520 host target genes. The mRNA of each one of this plurality of VGAM2520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2520 RNA, herein designated VGAM RNA, and which when bound by VGAM2520 RNA causes inhibition of translation of respective one or more VGAM2520 host target proteins.

[85428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2520 gene, herein designated VGAM GENE, on one or more VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85429] It is yet further appreciated that a function of VGAM2520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2520 correlate with, and may be deduced from, the identity of the host target genes which VGAM2520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85430] Nucleotide sequences of the VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2520 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2520 are further described hereinbelow with reference to Table 1.

[85431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2520 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85432] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2520 gene, herein designated VGAM is inhibition of expression of VGAM2520 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2520 correlate with, and may be deduced from, the identity of the target genes which VGAM2520 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85433] Breast Cancer 1, Early Onset (BRCA1, Accession NM_007295) is a VGAM2520 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II

or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10, designated SEQ ID:14171, SEQ ID:14177, SEQ ID:14184, SEQ ID:14190, SEQ ID:14196, SEQ ID:14204, SEQ ID:14210, SEQ ID:14216, SEQ ID:14222 and SEQ ID:14165 respectively, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85434] A function of VGAM2520 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM_007295). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482) is another VGAM2520 host target gene. HSPA4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA4 BINDING SITE, designated SEQ ID:42978, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85435] Another function of VGAM2520 is therefore inhibition of Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA4. Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is another VGAM2520 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6044, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85436] Another function of VGAM2520 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM55.Reticulon 3 (RTN3, Accession XM_058207) is another VGAM2520 host target gene. RTN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN3 BINDING SITE, designated SEQ ID:36585, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85437] Another function of VGAM2520 is therefore inhibition of Reticulon 3 (RTN3, Accession XM_058207), a gene which is a member of the reticulon (neuroendocrine-specific, NSP) family. Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN3. The function of RTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM596.Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 5 (SLC7A5, Accession NM_003486) is another VGAM2520 host target gene. SLC7A5 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:9578, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85438] Another function of VGAM2520 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 5 (SLC7A5, Accession NM_003486), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5. The function of SLC7A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.Mitogen-activated Protein Kinase Kinase 5 (MAP2K5, Accession NM_002757) is another VGAM2520 host target gene. MAP2K5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP2K5, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K5 BINDING SITE, designated SEQ ID:8638, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85439] Another function of VGAM2520 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 5 (MAP2K5, Accession NM_002757). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K5.

LOC132001 (Accession NM_138807) is another VGAM2520 host target gene. LOC132001 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132001 BINDING SITE, designated SEQ ID:29030, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85440] Another function of VGAM2520 is therefore inhibition of LOC132001 (Accession NM_138807). Accordingly, utilities

of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132001. LOC138050 (Accession XM_059937) is another VGAM2520 host target gene. LOC138050 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138050 BINDING SITE, designated SEQ ID:37116, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85441] Another function of VGAM2520 is therefore inhibition of LOC138050 (Accession XM_059937). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138050. LOC146901 (Accession XM_097121) is another VGAM2520 host target gene. LOC146901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146901 BINDING SITE, designated SEQ ID:40762, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85442] Another function of VGAM2520 is therefore inhibition of LOC146901 (Accession XM_097121). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146901. LOC151516 (Accession XM_087229) is another VGAM2520 host target gene. LOC151516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151516 BINDING SITE, designated SEQ ID:39130, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85443] Another function of VGAM2520 is therefore inhibition of LOC151516 (Accession XM_087229). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151516. LOC165741 (Accession XM_105272) is another VGAM2520 host target gene. LOC165741 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC165741, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165741 BINDING SITE, designated SEQ ID:42190, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85444] Another function of VGAM2520 is therefore inhibition of LOC165741 (Accession XM_105272). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165741. LOC222008 (Accession XM_168361) is another VGAM2520 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45124, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85445] Another function of VGAM2520 is therefore inhibition of

LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC253461 (Accession XM_172341) is another VGAM2520 host target gene. LOC253461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253461 BINDING SITE, designated SEQ ID:46074, to the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, also designated SEQ ID:5231.

[85446] Another function of VGAM2520 is therefore inhibition of LOC253461 (Accession XM_172341). Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253461. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2521 (VGAM2521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[85447] VGAM2521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2521 was detected is described hereinabove with reference to Figs. 1-8.

[85448] VGAM2521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85449] VGAM2521 gene encodes a VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2521 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2521 precursor RNA is designated SEQ ID:2507, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2507 is located at position 9443 relative to the genome of Mouse Cytomegalovirus 1.

[85450] VGAM2521 precursor RNA folds onto itself, forming VGAM2521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85451] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2521 folded precursor RNA into VGAM2521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2521 RNA is designated SEQ ID:5232, and is provided hereinbelow with reference to the sequence listing part.

[85452] VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2521 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85453] VGAM2521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2521 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[85454] The complementary binding of VGAM2521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2521 host target RNA into VGAM2521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85455] It is appreciated that VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2521 host target genes. The mRNA of each one of this plurality of VGAM2521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2521 RNA, herein designated VGAM RNA, and which when bound by VGAM2521 RNA causes inhibition of translation of respective one or more VGAM2521 host target proteins.

[85456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2521 gene, herein designated VGAM GENE, on one

or more VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85457] It is yet further appreciated that a function of VGAM2521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2521 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2521 correlate with, and may be deduced from, the identity of the host target genes which VGAM2521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85458] Nucleotide sequences of the VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2521 are further described hereinbelow with reference to Table 1.

[85459] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2521 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85460] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2521 gene, herein designated VGAM is inhibition of expression of VGAM2521 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2521 correlate with, and may be deduced from, the identity of the target genes which VGAM2521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85461] SEC22 Vesicle Trafficking Protein-like 1 (S. cerevisiae)

(SEC22L1, Accession NM_004892) is a VGAM2521 host target gene. SEC22L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC22L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC22L1 BINDING SITE, designated SEQ ID:11319, to the nucleotide sequence of VGAM2521 RNA, herein designated VGAM RNA, also designated SEQ ID:5232.

[85462] A function of VGAM2521 is therefore inhibition of SEC22 Vesicle Trafficking Protein-like 1 (S. cerevisiae) (SEC22L1, Accession NM_004892), a gene which may be involved in vesicle docking during transport between the ER and the Golgi apparatus. Accordingly, utilities of VGAM2521 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC22L1. The function of SEC22L1 has been established by previous studies. In S. cerevisiae, the vesicle trafficking protein complexes directing transport between the endoplasmic reticulum (ER) and Golgi appear to include Sed5 (see OMIM Ref. No. syntaxin-5; 603189), proposed to be a cis-Golgi receptor protein, and Sec22 and Bet1 (OMIM Ref. No. 605456), po-

tential Sed5 docking partners localized on ER-derived vesicles. The Sly1 protein may bind to and regulate the activity of Sed5 for docking with ER-derived vesicle proteins. See membrin (GOSR2; 604027). Hay et al. (1997) isolated a rat liver protein complex representing an intermediate in ER-to-Golgi transfer reactions. The complex contained syntaxin-5, GOS28 (OMIM Ref. No. 604026), the rat homologs of Bet1 and Sly1, and 2 novel proteins, rat sec22b and membrin. The authors isolated mouse sec22b cDNAs and determined that the sec22b protein is distinct from the previously identified rat sec22a protein. Sequence analysis revealed that mouse sec22b is a cytoplasmically oriented, C-terminally anchored integral membrane protein. By immunofluorescence of mammalian cells expressing epitope-tagged sec22b, Hay et al. (1997) found that sec22b and membrin accumulated primarily at the ER. Other members of the complex localized to Golgi membranes, indicating that the complex recapitulates vesicle docking between distinct organelles in the ER/Golgi transport cycle. Expression of recombinant membrin and sec22b disrupted normal trafficking, demonstrating that these proteins regulate ER-to-Golgi trafficking. Mao et al. (1998) identified an umbilical cord blood

CD34-positive cell cDNA encoding the human homolog of sec22b. The predicted human protein contains 215 amino acids. To fuse transport vesicles with target membranes, proteins of the SNARE complex must be located on both the vesicle and the target membrane. In yeast, 4 integral membrane proteins, Sed5, Bos1, Sec22, and Bet1 each are believed to contribute a single helix to form the SNARE complex that is needed for transport from endoplasmic reticulum to Golgi. This generates a 4-helix bundle, which ultimately mediates the actual fusion event. Parlati et al. (2000) explored how the anchoring arrangement of the 4 helices affects their ability to mediate fusion. Parlati et al. (2000) reconstituted 2 populations of phospholipid bilayer vesicles, with the individual SNARE proteins distributed in all possible combinations between them. Of the 8 nonredundant permutations of 4 subunits distributed over 2 vesicle populations, only 1 resulted in membrane fusion. Fusion occurred only when the v-SNARE Bet1 is on 1 membrane and the syntaxin heavy chain Sed5 and its 2 light chains, Bos1 and Sec22, are on the other membrane, where they form a functional t-SNARE. Thus, each SNARE protein is topologically restricted by design to function either as a v-SNARE or as part of a t-SNARE complex.

[85463] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85464] Mao, M.; Fu, G.; Wu, J.-S.; Zhang, Q.-H.; Zhou, J.; Kan, L.-X.; Huang, Q.-H.; He, K.-L.; Gu, B.-W.; Han, Z.-G.; Shen, Y.; Gu, J.; Yu, Y.-P.; Xu, S.-H.; Wang, Y.-X.; Chen, S.-J.; Chen, Z. : Identification of genes expressed in human CD34+ hematopoietic stem/progenitor cells by expressed sequence tags and efficient full-length cDNA cloning. Proc. Nat. Acad. Sci. 95: 8175-8180, 1998. ; and

[85465] Parlati, F.; McNew, J. A.; Fukuda, R.; Miller, R.; Sollner, T. H.; Rothman, J. E. : Topological restriction of SNARE-dependent membrane fusion. Nature 407: 194-198, 2000.

[85466] Further studies establishing the function and utilities of SEC22L1 are found in John Hopkins OMIM database record ID 604029, and in sited publications numbered 763 and 8801 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.KIAA0189 (Accession NM_014725) is another VGAM2521 host target gene. KIAA0189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0189, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0189 BINDING SITE, designated SEQ ID:16315, to the nucleotide sequence of VGAM2521 RNA, herein designated VGAM RNA, also designated SEQ ID:5232.

[85467] Another function of VGAM2521 is therefore inhibition of KIAA0189 (Accession NM_014725). Accordingly, utilities of VGAM2521 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0189. PRO1598 (Accession NM_018503) is another VGAM2521 host target gene. PRO1598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1598 BINDING SITE, designated SEQ ID:20570, to the nucleotide sequence of VGAM2521 RNA, herein designated VGAM RNA, also designated SEQ ID:5232.

[85468] Another function of VGAM2521 is therefore inhibition of PRO1598 (Accession NM_018503). Accordingly, utilities of VGAM2521 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO1598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2522 (VGAM2522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85469] VGAM2522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2522 was detected is described hereinabove with reference to Figs. 1-8.

[85470] VGAM2522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85471] VGAM2522 gene encodes a VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2522 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2522 precursor RNA is desig-

nated SEQ ID:2508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2508 is located at position 116189 relative to the genome of Mouse Cytomegalovirus 1.

[85472] VGAM2522 precursor RNA folds onto itself, forming VGAM2522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85473] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2522 folded precursor RNA into VGAM2522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2522 RNA is designated SEQ ID:5233, and is provided hereinbelow with reference to the sequence

listing part.

[85474] VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2522 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85475] VGAM2522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2522 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2522 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85476] The complementary binding of VGAM2522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2522 host target RNA into VGAM2522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85477] It is appreciated that VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2522 host target genes. The mRNA of each one of this plurality of VGAM2522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2522 RNA, herein designated VGAM

RNA, and which when bound by VGAM2522 RNA causes inhibition of translation of respective one or more VGAM2522 host target proteins.

[85478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2522 gene, herein designated VGAM GENE, on one or more VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85479] It is yet further appreciated that a function of VGAM2522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2522 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2522 correlate with, and may be deduced from, the identity of the host target genes which VGAM2522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85480] Nucleotide sequences of the VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2522 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2522 are further described hereinbelow with reference to Table 1.

[85481] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2522 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2522 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85482] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2522 gene, herein designated VGAM is

inhibition of expression of VGAM2522 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2522 correlate with, and may be deduced from, the identity of the target genes which VGAM2522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85483] Cullin 4B (CUL4B, Accession NM_003588) is a VGAM2522 host target gene. CUL4B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CUL4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL4B BINDING SITE, designated SEQ ID:9641, to the nucleotide sequence of VGAM2522 RNA, herein designated VGAM RNA, also designated SEQ ID:5233.

[85484] A function of VGAM2522 is therefore inhibition of Cullin 4B (CUL4B, Accession NM_003588), a gene which is a negative regulator of the cell cycle in C. elegans. Accordingly, utilities of VGAM2522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL4B. The function of CUL4B and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM140.Protein Tyrosine Phosphatase, Non-receptor Type 9 (PTPN9, Accession NM_002833) is another VGAM2522 host target gene. PTPN9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPN9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN9 BINDING SITE, designated SEQ ID:8711, to the nucleotide sequence of VGAM2522 RNA, herein designated VGAM RNA, also designated SEQ ID:5233.

[85485] Another function of VGAM2522 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 9 (PTPN9, Accession NM_002833). Accordingly, utilities of VGAM2522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN9. Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782) is another VGAM2522 host target gene. SNAP29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNAP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SNAP29 BINDING SITE, designated SEQ ID:11184, to the nucleotide sequence of VGAM2522 RNA, herein designated VGAM RNA, also designated SEQ ID:5233.

[85486] Another function of VGAM2522 is therefore inhibition of Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782). Accordingly, utilities of VGAM2522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP29. LOC254559 (Accession XM_172931) is another VGAM2522 host target gene. LOC254559 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254559 BINDING SITE, designated SEQ ID:46196, to the nucleotide sequence of VGAM2522 RNA, herein designated VGAM RNA, also designated SEQ ID:5233.

[85487] Another function of VGAM2522 is therefore inhibition of LOC254559 (Accession XM_172931). Accordingly, utilities of VGAM2522 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC254559. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2523 (VGAM2523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85488] VGAM2523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2523 was detected is described hereinabove with reference to Figs. 1-8.

[85489] VGAM2523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85490] VGAM2523 gene encodes a VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2523 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2523 precursor RNA is desig-

nated SEQ ID:2509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2509 is located at position 122311 relative to the genome of Mouse Cytomegalovirus 1.

[85491] VGAM2523 precursor RNA folds onto itself, forming VGAM2523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85492] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2523 folded precursor RNA into VGAM2523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2523 RNA is designated SEQ ID:5234, and is provided hereinbelow with reference to the sequence

listing part.

[85493] VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2523 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85494] VGAM2523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2523 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2523 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85495] The complementary binding of VGAM2523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2523 host target RNA into VGAM2523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85496] It is appreciated that VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2523 host target genes. The mRNA of each one of this plurality of VGAM2523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2523 RNA, herein designated VGAM

RNA, and which when bound by VGAM2523 RNA causes inhibition of translation of respective one or more VGAM2523 host target proteins.

[85497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2523 gene, herein designated VGAM GENE, on one or more VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85498] It is yet further appreciated that a function of VGAM2523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2523 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2523 correlate with, and may be deduced from, the identity of the host target genes which VGAM2523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85499] Nucleotide sequences of the VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2523 are further described hereinbelow with reference to Table 1.

[85500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2523 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85501] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2523 gene, herein designated VGAM is

inhibition of expression of VGAM2523 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2523 correlate with, and may be deduced from, the identity of the target genes which VGAM2523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85502] Proteoglycan 2, Bone Marrow (natural killer cell activator, eosinophil granule major basic protein) (PRG2, Accession NM_002728) is a VGAM2523 host target gene. PRG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRG2 BINDING SITE, designated SEQ ID:8593, to the nucleotide sequence of VGAM2523 RNA, herein designated VGAM RNA, also designated SEQ ID:5234.

[85503] A function of VGAM2523 is therefore inhibition of Proteoglycan 2, Bone Marrow (natural killer cell activator, eosinophil granule major basic protein) (PRG2, Accession NM_002728), a gene which Myelin basic protein; a constituent of myelin, plays a role in nerve function. Accordingly, utilities of VGAM2523 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PRG2. The function of PRG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2524 (VGAM2524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85504] VGAM2524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2524 was detected is described hereinabove with reference to Figs. 1-8.

[85505] VGAM2524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85506] VGAM2524 gene encodes a VGAM2524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2524 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2524 precursor RNA is designated SEQ ID:2510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2510 is located at position 180093 relative to the genome of Mouse Cytomegalovirus 1.

[85507] VGAM2524 precursor RNA folds onto itself, forming VGAM2524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85508] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2524 folded precursor RNA into VGAM2524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2524 RNA is designated SEQ ID:5235, and is provided hereinbelow with reference to the sequence listing part.

[85509] VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2524 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85510] VGAM2524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2524 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85511] The complementary binding of VGAM2524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2524 host target RNA into VGAM2524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85512] It is appreciated that VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2524 host target genes. The mRNA of each one of this plurality of VGAM2524 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2524 RNA, herein designated VGAM RNA, and which when bound by VGAM2524 RNA causes inhibition of translation of respective one or more VGAM2524 host target proteins.

[85513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2524 gene, herein designated VGAM GENE, on one or more VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85514] It is yet further appreciated that a function of VGAM2524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2524 correlate with, and may be deduced from, the identity of the host target genes which VGAM2524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85515] Nucleotide sequences of the VGAM2524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2524 are further described hereinbelow with reference to Table 1.

[85516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2524 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2524 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[85517] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2524 gene, herein designated VGAM is inhibition of expression of VGAM2524 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2524 correlate with, and may be deduced from, the identity of the target genes which VGAM2524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85518] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM2524 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7597, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85519] A function of VGAM2524 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils

and other extracellular matrix molecules. Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM_000118) is another VGAM2524 host target gene. ENG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:5595, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85520] Another function of VGAM2524 is therefore inhibition of Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM_000118). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. High-mobility Group Nucleosomal Binding Domain 2 (HMGN2, Accession

NM_005517) is another VGAM2524 host target gene. HMGN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGN2 BINDING SITE, designated SEQ ID:12041, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85521] Another function of VGAM2524 is therefore inhibition of High-mobility Group Nucleosomal Binding Domain 2 (HMGN2, Accession NM_005517), a gene which binds HMG proteins and may confer specific conformations to transcriptionally active regions of chromatin. Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN2. The function of HMGN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2461.Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is another VGAM2524 host target gene. IL1F5 BINDING SITE1 and

IL1F5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by IL1F5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE1 and IL1F5 BINDING SITE2, designated SEQ ID:14601 and SEQ ID:14602 respectively, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85522] Another function of VGAM2524 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263.Activator of Basal Transcription 1 (ABT1, Accession NM_013375) is another VGAM2524 host target gene. ABT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABT1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABT1 BINDING SITE, designated SEQ ID:15030, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85523] Another function of VGAM2524 is therefore inhibition of Activator of Basal Transcription 1 (ABT1, Accession NM_013375). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABT1. DKFZP434K1421 (Accession NM_032141) is another VGAM2524 host target gene. DKFZP434K1421 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434K1421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1421 BINDING SITE, designated SEQ ID:25823, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85524] Another function of VGAM2524 is therefore inhibition of DKFZP434K1421 (Accession NM_032141). Accordingly, utilities of VGAM2524 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434K1421. DKFZP761F241 (Accession NM_031455) is another VGAM2524 host target gene. DKFZP761F241 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761F241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:25477, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85525] Another function of VGAM2524 is therefore inhibition of DKFZP761F241 (Accession NM_031455). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241. FLJ12903 (Accession NM_022753) is another VGAM2524 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ12903 BINDING SITE, designated SEQ ID:22980, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85526] Another function of VGAM2524 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. KIAA0430 (Accession NM_019081) is another VGAM2524 host target gene. KIAA0430 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0430 BINDING SITE, designated SEQ ID:21149, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85527] Another function of VGAM2524 is therefore inhibition of KIAA0430 (Accession NM_019081). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0430. KIAA0676 (Accession NM_015043) is another VGAM2524 host target gene. KIAA0676 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17393, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85528] Another function of VGAM2524 is therefore inhibition of KIAA0676 (Accession NM_015043). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. KIAA1036 (Accession NM_014909) is another VGAM2524 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17132, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85529] Another function of VGAM2524 is therefore inhibition of

KIAA1036 (Accession NM_014909). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1393 (Accession XM_050793) is another VGAM2524 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35688, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85530] Another function of VGAM2524 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. Postmeiotic Segregation Increased 2-like 3 (PMS2L3, Accession XM_049100) is another VGAM2524 host target gene. PMS2L3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PMS2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMS2L3 BINDING SITE, designated SEQ ID:35342, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85531] Another function of VGAM2524 is therefore inhibition of Postmeiotic Segregation Increased 2-like 3 (PMS2L3, Accession XM_049100). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMS2L3. Uronyl-2-sulfotransferase (UST, Accession NM_005715) is another VGAM2524 host target gene. UST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UST BINDING SITE, designated SEQ ID:12271, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85532] Another function of VGAM2524 is therefore inhibition of Uronyl-2-sulfotransferase (UST, Accession NM_005715). Accordingly, utilities of VGAM2524 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with UST. LOC115343 (Accession XM_050640) is another VGAM2524 host target gene. LOC115343 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115343 BINDING SITE, designated SEQ ID:35667, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85533] Another function of VGAM2524 is therefore inhibition of LOC115343 (Accession XM_050640). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115343. LOC145268 (Accession XM_085072) is another VGAM2524 host target gene. LOC145268 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145268 BINDING SITE, designated SEQ ID:37811, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85534] Another function of VGAM2524 is therefore inhibition of LOC145268 (Accession XM_085072). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145268. LOC152212 (Accession XM_096198) is another VGAM2524 host target gene. LOC152212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152212 BINDING SITE, designated SEQ ID:40308, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85535] Another function of VGAM2524 is therefore inhibition of LOC152212 (Accession XM_096198). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152212. LOC152267 (Accession XM_017070) is another VGAM2524 host target gene. LOC152267 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152267 BINDING SITE, designated SEQ ID:30295, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85536] Another function of VGAM2524 is therefore inhibition of LOC152267 (Accession XM_017070). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152267. LOC158382 (Accession XM_098931) is another VGAM2524 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:41963, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85537] Another function of VGAM2524 is therefore inhibition of

LOC158382 (Accession XM_098931). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382. LOC220926 (Accession XM_166128) is another VGAM2524 host target gene. LOC220926 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220926 BINDING SITE, designated SEQ ID:43917, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85538] Another function of VGAM2524 is therefore inhibition of LOC220926 (Accession XM_166128). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220926. LOC222189 (Accession XM_168447) is another VGAM2524 host target gene. LOC222189 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC222189 BINDING SITE, designated SEQ ID:45188, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85539] Another function of VGAM2524 is therefore inhibition of LOC222189 (Accession XM_168447). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222189. LOC90371 (Accession XM_031261) is another VGAM2524 host target gene. LOC90371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90371 BINDING SITE, designated SEQ ID:31322, to the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, also designated SEQ ID:5235.

[85540] Another function of VGAM2524 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2525 (VGAM2525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85541] VGAM2525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2525 was detected is described hereinabove with reference to Figs. 1-8.

[85542] VGAM2525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85543] VGAM2525 gene encodes a VGAM2525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2525 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2525 precursor RNA is designated SEQ ID:2511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2511 is located at position 213327 relative to the genome of Mouse Cytomegalovirus 1.

[85544] VGAM2525 precursor RNA folds onto itself, forming VGAM2525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85545] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2525 folded precursor RNA into VGAM2525 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2525 RNA is designated SEQ ID:5236, and is provided hereinbelow with reference to the sequence listing part.

[85546] VGAM2525 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2525 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85547] VGAM2525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2525 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2525 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85548] The complementary binding of VGAM2525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2525 host target RNA into VGAM2525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85549] It is appreciated that VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2525 host target genes. The mRNA of each one of this plurality of VGAM2525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2525 RNA, herein designated VGAM RNA, and which when bound by VGAM2525 RNA causes inhibition of translation of respective one or more

VGAM2525 host target proteins.

[85550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2525 gene, herein designated VGAM GENE, on one or more VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85551] It is yet further appreciated that a function of VGAM2525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2525 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2525 correlate with, and may be deduced from, the identity of the host target genes which VGAM2525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85552] Nucleotide sequences of the VGAM2525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2525 are further described hereinbelow with reference to Table 1.

[85553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2525 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85554] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2525 gene, herein designated VGAM is inhibition of expression of VGAM2525 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2525 correlate with, and may be deduced from, the identity of the target genes which VGAM2525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85555] Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393) is a VGAM2525 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10631, to the nucleotide sequence of VGAM2525 RNA, herein designated VGAM RNA, also designated SEQ ID:5236.

[85556] A function of VGAM2525 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM2525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM1095.Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM2525 host target gene. DGKD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29876, to the nucleotide sequence of VGAM2525 RNA, herein designated VGAM RNA, also designated SEQ ID:5236.

[85557] Another function of VGAM2525 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM2525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. KIAA0746 (Accession XM_045277) is another VGAM2525 host target gene. KIAA0746 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0746 BINDING SITE, designated

SEQ ID:34413, to the nucleotide sequence of VGAM2525 RNA, herein designated VGAM RNA, also designated SEQ ID:5236.

[85558] Another function of VGAM2525 is therefore inhibition of KIAA0746 (Accession XM_045277). Accordingly, utilities of VGAM2525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0746. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2526 (VGAM2526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85559] VGAM2526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2526 was detected is described hereinabove with reference to Figs. 1-8.

[85560] VGAM2526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85561] VGAM2526 gene encodes a VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2526 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2526 precursor RNA is designated SEQ ID:2512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2512 is located at position 85449 relative to the genome of Mouse Cytomegalovirus 1.

[85562] VGAM2526 precursor RNA folds onto itself, forming VGAM2526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85563] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2526 folded precursor RNA into VGAM2526 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2526 RNA is designated SEQ ID:5237, and is provided hereinbelow with reference to the sequence listing part.

[85564] VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2526 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85565] VGAM2526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2526 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85566] The complementary binding of VGAM2526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2526 host target RNA into VGAM2526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85567] It is appreciated that VGAM2526 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2526 host target genes. The mRNA of each one of this plurality of VGAM2526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2526 RNA, herein designated VGAM RNA, and which when bound by VGAM2526 RNA causes inhibition of translation of respective one or more VGAM2526 host target proteins.

[85568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2526 gene, herein designated VGAM GENE, on one or more VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85569] It is yet further appreciated that a function of VGAM2526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2526 correlate with, and may be deduced from, the identity of the host target genes which VGAM2526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85570] Nucleotide sequences of the VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2526 are further described hereinbelow with reference to Table 1.

[85571] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2526 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85572] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2526 gene, herein designated VGAM is inhibition of expression of VGAM2526 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2526 correlate with, and may be deduced from, the identity of the target genes which VGAM2526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85573] Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935) is a VGAM2526 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12566, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85574] A function of VGAM2526 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025) is another VGAM2526 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8959, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85575] Another function of VGAM2526 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession

NM_003025). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. FLJ13576 (Accession NM_022484) is another VGAM2526 host target gene. FLJ13576 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13576 BINDING SITE, designated SEQ ID:22860, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85576] Another function of VGAM2526 is therefore inhibition of FLJ13576 (Accession NM_022484). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13576. FLJ13769 (Accession NM_025012) is another VGAM2526 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24594, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85577] Another function of VGAM2526 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. PRO2964 (Accession NM_018547) is another VGAM2526 host target gene. PRO2964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2964 BINDING SITE, designated SEQ ID:20629, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85578] Another function of VGAM2526 is therefore inhibition of PRO2964 (Accession NM_018547). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2964. LOC145368 (Accession XM_085112) is another

VGAM2526 host target gene. LOC145368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145368 BINDING SITE, designated SEQ ID:37825, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85579] Another function of VGAM2526 is therefore inhibition of LOC145368 (Accession XM_085112). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145368. LOC150423 (Accession XM_086912) is another VGAM2526 host target gene. LOC150423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150423 BINDING SITE, designated SEQ ID:38966, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85580] Another function of VGAM2526 is therefore inhibition of LOC150423 (Accession XM_086912). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150423. LOC158055 (Accession XM_088453) is another VGAM2526 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39701, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85581] Another function of VGAM2526 is therefore inhibition of LOC158055 (Accession XM_088453). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. LOC197117 (Accession XM_116989) is another VGAM2526 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197117 BINDING SITE, designated SEQ ID:43191, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85582] Another function of VGAM2526 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. LOC220164 (Accession XM_166294) is another VGAM2526 host target gene. LOC220164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220164 BINDING SITE, designated SEQ ID:44108, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85583] Another function of VGAM2526 is therefore inhibition of LOC220164 (Accession XM_166294). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220164. LOC255481 (Accession XM_170489) is another VGAM2526 host target gene. LOC255481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255481 BINDING SITE, designated SEQ ID:45331, to the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, also designated SEQ ID:5237.

[85584] Another function of VGAM2526 is therefore inhibition of LOC255481 (Accession XM_170489). Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255481. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2527 (VGAM2527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85585] VGAM2527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2527 was detected is described hereinabove with reference to Figs. 1-8.

[85586] VGAM2527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85587] VGAM2527 gene encodes a VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2527 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2527 precursor RNA is designated SEQ ID:2513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2513 is located at position 157147 relative to the genome of Mouse Cytomegalovirus 1.

[85588] VGAM2527 precursor RNA folds onto itself, forming VGAM2527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85589] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2527 folded precursor RNA into VGAM2527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2527 RNA is designated SEQ ID:5238, and is provided hereinbelow with reference to the sequence listing part.

[85590] VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2527 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85591] VGAM2527 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2527 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85592] The complementary binding of VGAM2527 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2527 host target RNA into VGAM2527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85593] It is appreciated that VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2527 host target genes. The mRNA of each one of this plurality of VGAM2527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2527 RNA, herein designated VGAM RNA, and which when bound by VGAM2527 RNA causes inhibition of translation of respective one or more VGAM2527 host target proteins.

[85594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2527 gene, herein designated VGAM GENE, on one or more VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85595] It is yet further appreciated that a function of VGAM2527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2527 correlate with, and may be deduced from, the identity of the host target genes which VGAM2527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85596] Nucleotide sequences of the VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2527 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2527 are further described hereinbelow with reference to Table 1.

[85597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2527 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85598] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2527 gene, herein designated VGAM is inhibition of expression of VGAM2527 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2527 correlate with, and may be deduced from, the identity of the target genes which VGAM2527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85599] Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is a VGAM2527 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTR1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13638, to the nucleotide sequence of VGAM2527 RNA, herein designated VGAM RNA, also designated SEQ ID:5238.

[85600] A function of VGAM2527 is therefore inhibition of Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. KIAA1643 (Accession XM_035371) is another VGAM2527 host target gene. KIAA1643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:32241, to the nucleotide sequence of VGAM2527 RNA, herein designated VGAM RNA, also designated SEQ ID:5238.

[85601] Another function of VGAM2527 is therefore inhibition of

KIAA1643 (Accession XM_035371). Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. LOC164395 (Accession XM_092778) is another VGAM2527 host target gene. LOC164395 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164395 BINDING SITE, designated SEQ ID:40144, to the nucleotide sequence of VGAM2527 RNA, herein designated VGAM RNA, also designated SEQ ID:5238.

[85602] Another function of VGAM2527 is therefore inhibition of LOC164395 (Accession XM_092778). Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164395. LOC255177 (Accession XM_172941) is another VGAM2527 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:46200, to the nucleotide sequence of VGAM2527 RNA, herein designated VGAM RNA, also designated SEQ ID:5238.

[85603] Another function of VGAM2527 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2528 (VGAM2528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85604] VGAM2528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2528 was detected is described hereinabove with reference to Figs. 1-8.

[85605] VGAM2528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[85606] VGAM2528 gene encodes a VGAM2528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2528 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2528 precursor RNA is designated SEQ ID:2514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2514 is located at position 17101 relative to the genome of Cowpox Virus.

[85607] VGAM2528 precursor RNA folds onto itself, forming VGAM2528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85608] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2528 folded precursor RNA into VGAM2528 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2528 RNA is designated SEQ ID:5239, and is provided hereinbelow with reference to the sequence listing part.

[85609] VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2528 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85610] VGAM2528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2528 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85611] The complementary binding of VGAM2528 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2528 host target RNA into VGAM2528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85612] It is appreciated that VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2528 host target genes. The mRNA of each one of this plurality of VGAM2528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2528 RNA, herein designated VGAM RNA, and which when bound by VGAM2528 RNA causes inhibition of translation of respective one or more VGAM2528 host target proteins.

[85613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2528 gene, herein designated VGAM GENE, on one or more VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85614] It is yet further appreciated that a function of VGAM2528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2528 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2528 correlate with, and may be deduced from, the identity of the host target genes which VGAM2528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85615] Nucleotide sequences of the VGAM2528 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2528 are further described hereinbelow with reference to Table 1.

[85616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2528 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85617] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2528 gene, herein designated VGAM is inhibition of expression of VGAM2528 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2528 correlate with, and may be deduced from, the identity of the target genes which VGAM2528 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85618] Chloride Channel 6 (CLCN6, Accession NM_001286) is a VGAM2528 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:6960, SEQ ID:22342 and SEQ ID:22337 respectively, to the nucleotide sequence of

VGAM2528 RNA, herein designated VGAM RNA, also designated SEQ ID:5239.

[85619] A function of VGAM2528 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM_001286), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM2528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM599.KIAA0319 (Accession NM_014809) is another VGAM2528 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16761, to the nucleotide sequence of VGAM2528 RNA, herein designated VGAM RNA, also designated SEQ ID:5239.

[85620] Another function of VGAM2528 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities

of VGAM2528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM2528 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39930, to the nucleotide sequence of VGAM2528 RNA, herein designated VGAM RNA, also designated SEQ ID:5239.

[85621] Another function of VGAM2528 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM2528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. LOC123264 (Accession XM_058693) is another VGAM2528 host target gene. LOC123264 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123264 BINDING SITE, designated SEQ ID:36723, to the nucleotide sequence of VGAM2528 RNA, herein designated VGAM RNA, also designated SEQ ID:5239.

[85622] Another function of VGAM2528 is therefore inhibition of LOC123264 (Accession XM_058693). Accordingly, utilities of VGAM2528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123264. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2529 (VGAM2529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85623] VGAM2529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2529 was detected is described hereinabove with reference to Figs. 1-8.

[85624] VGAM2529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Ringspot Virus. VGAM2529 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[85625] VGAM2529 gene encodes a VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2529 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2529 precursor RNA is designated SEQ ID:2515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2515 is located at position 4230 relative to the genome of Pepper Ringspot Virus.

[85626] VGAM2529 precursor RNA folds onto itself, forming VGAM2529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85627] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2529 folded precursor RNA into VGAM2529

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2529 RNA is designated SEQ ID:5240, and is provided hereinbelow with reference to the sequence listing part.

[85628] VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2529 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85629] VGAM2529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2529 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85630] The complementary binding of VGAM2529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2529 host target RNA into VGAM2529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[85631] It is appreciated that VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2529 host target genes. The mRNA of each one of this plurality of VGAM2529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2529 RNA, herein designated VGAM RNA, and which when bound by VGAM2529 RNA causes inhibition of translation of respective one or more VGAM2529 host target proteins.

[85632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2529 gene, herein designated VGAM GENE, on one or more VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85633] It is yet further appreciated that a function of VGAM2529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2529 include diagnosis, prevention and treatment of viral infection by Pepper Ringspot Virus. Specific functions, and accordingly utilities, of VGAM2529 correlate with, and may be deduced from, the identity of the host target genes which VGAM2529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85634] Nucleotide sequences of the VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2529 are further described hereinbelow with reference to Table 1.

[85635] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2529 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85636] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2529 gene, herein designated VGAM is inhibition of expression of VGAM2529 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2529 correlate with, and may be deduced from, the identity of the target genes which VGAM2529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85637] SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM_030764) is a VGAM2529 host target gene. SPAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAP1 BINDING SITE, designated SEQ ID:25048, to the nucleotide sequence of VGAM2529 RNA,

herein designated VGAM RNA, also designated SEQ ID:5240.

[85638] A function of VGAM2529 is therefore inhibition of SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM_030764), a gene which regulation of immunologic function. Accordingly, utilities of VGAM2529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAP1. The function of SPAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM672.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2530 (VGAM2530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85639] VGAM2530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2530 was detected is described hereinabove with reference to Figs. 1-8.

[85640] VGAM2530 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Pepper Ringspot Virus. VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85641] VGAM2530 gene encodes a VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2530 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2530 precursor RNA is designated SEQ ID:2516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2516 is located at position 1886 relative to the genome of Pepper Ringspot Virus.

[85642] VGAM2530 precursor RNA folds onto itself, forming VGAM2530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85643] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2530 folded precursor RNA into VGAM2530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2530 RNA is designated SEQ ID:5241, and is provided hereinbelow with reference to the sequence listing part.

[85644] VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2530 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85645] VGAM2530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2530 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85646] The complementary binding of VGAM2530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2530

host target RNA into VGAM2530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85647] It is appreciated that VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2530 host target genes. The mRNA of each one of this plurality of VGAM2530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2530 RNA, herein designated VGAM RNA, and which when bound by VGAM2530 RNA causes inhibition of translation of respective one or more VGAM2530 host target proteins.

[85648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2530 gene, herein designated VGAM GENE, on one or more VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85649] It is yet further appreciated that a function of VGAM2530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of viral infection by Pepper Ringspot Virus. Specific functions, and accordingly utilities, of VGAM2530 correlate with, and may be deduced from, the identity of the host target genes which VGAM2530 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85650] Nucleotide sequences of the VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2530 are further

described hereinbelow with reference to Table 1.

[85651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2530 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85652] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2530 gene, herein designated VGAM is inhibition of expression of VGAM2530 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2530 correlate with, and may be deduced from, the identity of the target genes which VGAM2530 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85653] B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326) is a VGAM2530 host target gene. BCL9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE,

designated SEQ ID:10525, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85654] A function of VGAM2530 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326), a gene which recruits of PYGO to the nuclear beta-catenin-TCF complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Calpain 10 (CAPN10, Accession NM_023089) is another VGAM2530 host target gene. CAPN10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPN10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN10 BINDING SITE, designated SEQ ID:23359, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85655] Another function of VGAM2530 is therefore inhibition of Calpain 10 (CAPN10, Accession NM_023089), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Coproporphyrinogen Oxidase (coproporphyria, harderoporphyria) (CPO, Accession NM_000097) is another VGAM2530 host target gene. CPO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPO BINDING SITE, designated SEQ ID:5557, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85656] Another function of VGAM2530 is therefore inhibition of Coproporphyrinogen Oxidase (coproporphyria, hardero-

porphyria) (CPO, Accession NM_000097), a gene which Coproporphyrinogen; catalyzes oxidative decarboxylation in sixth step of heme biosynthesis. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPO. The function of CPO has been established by previous studies. Brewer et al. (1999) presented clinical, cytogenetic, molecular, and statistical evidence for the existence of a novel locus for isolated CP at 2q32. They studied 2 unrelated children with strikingly similar clinical features, in whom there were apparently balanced, de novo cytogenetic rearrangements involving the same region of 2q. Both children had cleft palate, facial dysmorphism, and mild learning disability. Molecular cytogenetic analyses localized both translocation breakpoints between markers D2S311 and D2S116 on chromosome 2. This suggested that the true location of these breakpoints was 2q32 rather than 2q33, as had been suggested on cytogenetic grounds alone. To obtain independent support for the existence of a CP locus at 2q32, the authors performed a detailed statistical analysis for all cases in the human cytogenetics database of nonmosaic, single, contiguous autosomal deletions associated with orofacial clefting; see

Brewer et al. (1998). This analysis showed 2q32 to be 1 of only 3 chromosomal regions in which haploinsufficiency is significantly associated with isolated CP. Thus, the data provided strong evidence for the existence at 2q32 of a gene that is critical for the development of the secondary palate. The close proximity of the 2 translocation breakpoints should allow rapid progress toward positional cloning of this CP gene Van den Boogaard et al. (2000) identified a stop codon in the MSX1 gene (142983.0002) in a 3-generation Dutch family with tooth agenesis and combinations of cleft palate only and cleft lip and cleft palate, providing further evidence for this gene in orofacial clefting.

[85657] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85658] Brewer, C. M.; Leek, J. P.; Green, A. J.; Holloway, S.; Bonthron, D. T.; Markham, A. F.; FitzPatrick, D. R. : A locus for isolated cleft palate, located on human chromosome 2q32. Am. J. Hum. Genet. 65: 387-396, 1999. ; and

[85659] van den Boogaard, M.-J. H.; Dorland, M.; Beemer, F. A.; Ploos van Amstel, H. K. : MSX1 mutation is associated with orofacial clefting and tooth agenesis in humans. (Letter)

Nature Gene.

[85660] Further studies establishing the function and utilities of CPO are found in John Hopkins OMIM database record ID 119540, and in sited publications numbered 3721-3725, 3584, 3728, 3778-3779, 372 and 11320 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cardiotrophin 1 (CTF1, Accession NM_001330) is another VGAM2530 host target gene. CTF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTF1 BINDING SITE, designated SEQ ID:7013, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85661] Another function of VGAM2530 is therefore inhibition of Cardiotrophin 1 (CTF1, Accession NM_001330), a gene which may play a role in cardiac hypertrophy. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTF1. The function of CTF1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM71.Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902) is another VGAM2530 host target gene. CTH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CTH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTH BINDING SITE, designated SEQ ID:7626, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85662] Another function of VGAM2530 is therefore inhibition of Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902), a gene which catalyzes removal of ammonia, cleaves cystathionine to yield free cys. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTH. The function of CTH has been established by previous studies. The rate of glutathione synthesis in the liver is limited by the availability of cysteine which is provided either in the diet or by the trans-sulfuration pathway in which cystathionine derived from methionine

is transformed into cysteine by cystathionase (cystathionine gamma-lyase; EC 4.4.1.1). Lu et al. (1992) found and sequenced a 1,083-bp cDNA encoding the human liver cystathionine gamma-lyase. The human sequence presented a deletion of 132 bases (44 amino acids) compared to the cystathionase sequence reported for the rat, and a deletion of 135 bases (45 amino acids) compared to the sequence reported for yeast. After realignment for the missing nucleotides, the human cDNA sequence showed significant amino acid homology to the rat (85%) and yeast (50%) enzymes. Using the polymerase chain reaction, Lu et al. (1992) isolated a second clone which contained the missing 132 bases. Flanking nucleotides in the latter clone were identical to those in the cDNA clone containing the deletion. Alternative splicing as the basis of the 2 forms of cystathionase is plausible During a survey by paper chromatography of amino acids in the urine of patients in an institution for mental defectives, Harris et al. (1959) discovered a case with abnormal excretion of cystathionine. An inborn error involving the cleavage of cystathionine to give cysteine and homoserine was suggested. The subject was a severely retarded female, aged 64 years at the time of study. Another case

was studied at The New York Hospital. Other clinical manifestations have been clubfoot, developmental defects about the ears, convulsions, and thrombocytopenia. Urinary lithiasis also occurs. Frimpter (1965) has shown that the defect involves cystathionase that does not properly bind its coenzyme, pyridoxal phosphate. In vitro studies suggested that high pyridoxine would be therapeutically beneficial. Mongeau et al. (1967) described the case of a 2-year-old boy with normal mentality, thrombocytopenia, and urinary calculi. The relation of the latter two features to the metabolic defect was problematical. Both parents (who were apparently unrelated) showed cystathioninuria after methionine loading test. With administration of pyridoxine, cystathioninuria was diminished in the proband. Schneiderman (1967) studied 2 mentally retarded brothers who excreted large amounts of cystathionine after methionine ingestion. The mother and another brother excreted lesser but abnormal amounts after methionine loading. The father was not tested. Perry et al. (1968) discovered cystathioninuria in a brother and sister when the brother's urine was by chance subjected to 2-dimensional paper chromatography for amino acids. Both children were normal. The parents excreted cystathionine only af-

ter methionine loading. The authors suggested that mental defect and other disorders reported in association with cystathioninuria may have been coincidental. Whelan and Scriver (1968) also found cystathioninuria as an apparently benign inborn error. The case of Tada et al. (1968) did not respond to vitamin

[85663] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85664] Lu, Y.; O'Dowd, B. F.; Orrego, H.; Israel, Y. : Cloning and nucleotide sequence of human liver cDNA encoding for cystathionine gamma-lyase. Biochem. Biophys. Res. Commun. 189: 749-758, 1992. ; and

[85665] Whelan, D. T.; Scriver, C. R. : Cystathioninuria and renal iminoglycinuria in a pedigree: a perspective on counseling. New Eng. J. Med. 278: 924-927, 1968.

[85666] Further studies establishing the function and utilities of CTH are found in John Hopkins OMIM database record ID 219500, and in sited publications numbered 9352-9366 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729) is another VGAM2530 host target gene. DIAPH2 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DIAPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:13562, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85667] Another function of VGAM2530 is therefore inhibition of Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729), a gene which may affect in oogenesis. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIAPH2. The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM129.Deoxyribonuclease I (DNASE1, Accession NM_005223) is another VGAM2530 host target gene. DNASE1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1 BINDING SITE, designated SEQ ID:11713, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85668] Another function of VGAM2530 is therefore inhibition of Deoxyribonuclease I (DNASE1, Accession NM_005223), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1. The function of DNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492.Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM_034424) is another VGAM2530 host target gene. FACL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FACL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL5 BINDING SITE, designated SEQ ID:32107, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA,

also designated SEQ ID:5241.

[85669] Another function of VGAM2530 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM_034424), a gene which may be involved in fatty acid metabolism; contains an AMP-binding domain. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL5. The function of FACL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM357.Flap Structure-specific Endonuclease 1 (FEN1, Accession NM_004111) is another VGAM2530 host target gene. FEN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEN1 BINDING SITE, designated SEQ ID:10321, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85670] Another function of VGAM2530 is therefore inhibition of Flap Structure-specific Endonuclease 1 (FEN1, Accession

NM_004111), a gene which Flap endonuclease; double-stranded DNA 5'-3' exonuclease. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEN1. The function of FEN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217.Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028) is another VGAM2530 host target gene. FNTB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FNTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNTB BINDING SITE, designated SEQ ID:7784, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85671] Another function of VGAM2530 is therefore inhibition of Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028), a gene which transfers farnesyl groups to proteins. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNTB. The function of FNTB

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM615.Glycine Receptor, Alpha 3 (GLRA3, Accession XM_011092) is another VGAM2530 host target gene. GLRA3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GLRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLRA3 BINDING SITE, designated SEQ ID:30169, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85672] Another function of VGAM2530 is therefore inhibition of Glycine Receptor, Alpha 3 (GLRA3, Accession XM_011092), a gene which increases the chloride conductance and thus produces hyperpolarization (inhibition of neuronal firing). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLRA3. The function of GLRA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM602.GSBS

(Accession XM_165869) is another VGAM2530 host target gene. GSBS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GSBS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GSBS BINDING SITE, designated SEQ ID:43787, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85673] Another function of VGAM2530 is therefore inhibition of GSBS (Accession XM_165869). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSBS. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949) is another VGAM2530 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10077, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85674] Another function of VGAM2530 is therefore inhibition of Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM2530 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11953, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85675] Another function of VGAM2530 is therefore inhibition of

Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.NGFI-A Binding Protein 1 (EGR1 binding protein 1) (NAB1, Accession NM_005966) is another VGAM2530 host target gene. NAB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAB1 BINDING SITE, designated SEQ ID:12588, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85676] Another function of VGAM2530 is therefore inhibition of NGFI-A Binding Protein 1 (EGR1 binding protein 1) (NAB1, Accession NM_005966), a gene which acts as a transcriptional repressor for zinc finger transcription factors egr1

and egr2 (by similarity). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAB1. The function of NAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1074.Orthopedia Homolog (Drosophila) (OTP, Accession NM_032109) is another VGAM2530 host target gene. OTP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTP BINDING SITE, designated SEQ ID:25802, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85677] Another function of VGAM2530 is therefore inhibition of Orthopedia Homolog (Drosophila) (OTP, Accession NM_032109), a gene which involves in the development of the forebrain and spinal cord. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTP. The function of OTP and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM183.P53AIP1 (Accession NM_022112) is another VGAM2530 host target gene. P53AIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P53AIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P53AIP1 BINDING SITE, designated SEQ ID:22660, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85678] Another function of VGAM2530 is therefore inhibition of P53AIP1 (Accession NM_022112). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P53AIP1. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 2 (p85 beta) (PIK3R2, Accession NM_005027) is another VGAM2530 host target gene. PIK3R2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PIK3R2 BINDING SITE, designated SEQ ID:11467, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85679] Another function of VGAM2530 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 2 (p85 beta) (PIK3R2, Accession NM_005027), a gene which acts as an adapter and is regulatory subunit (p85 beta) of phosphatidylinositol 3-kinase. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R2. The function of PIK3R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM647.Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032104) is another VGAM2530 host target gene. PPP1R12B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ

ID:25798, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85680] Another function of VGAM2530 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032104). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. RIG (Accession NM_006394) is another VGAM2530 host target gene. RIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG BINDING SITE, designated SEQ ID:13109, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85681] Another function of VGAM2530 is therefore inhibition of RIG (Accession NM_006394), a gene which is ribosomal protein S15. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG. The function of RIG

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2, Accession NM_016932) is another VGAM2530 host target gene. SIX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIX2 BINDING SITE, designated SEQ ID:18851, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85682] Another function of VGAM2530 is therefore inhibition of Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2, Accession NM_016932), a gene which may be involved in limb tendon and ligament development (by similarity). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIX2. The function of SIX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.SRY (sex determin-

ing region Y)-box 13 (SOX13, Accession NM_005686) is another VGAM2530 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12246, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85683] Another function of VGAM2530 is therefore inhibition of SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13. Transgelin 2 (TAGLN2, Accession NM_003564) is another VGAM2530 host target gene. TAGLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAGLN2 BINDING SITE, designated SEQ ID:9621, to the nucleotide sequence of

VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85684] Another function of VGAM2530 is therefore inhibition of Transgelin 2 (TAGLN2, Accession NM_003564), a gene which is similar to transgelins and may be an actin-binding proteins. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAGLN2. The function of TAGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544) is another VGAM2530 host target gene. TAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAP2 BINDING SITE, designated SEQ ID:6144, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85685] Another function of VGAM2530 is therefore inhibition of

Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544), a gene which is involved in the transport of antigens from the cytoplasm to a membrane-bound compartment for association with mhc class i molecules. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAP2. The function of TAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243) is another VGAM2530 host target gene. TGFBR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFBR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:9250, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85686] Another function of VGAM2530 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan,

300kDa) (TGFBR3, Accession NM_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139.Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM_005430) is another VGAM2530 host target gene. WNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT1 BINDING SITE, designated SEQ ID:11898, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85687] Another function of VGAM2530 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM_005430), a gene which may have a role in development of the central nervous system. Ac-

cordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT1. The function of WNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Zinc Finger Protein 137 (clone pHZ-30) (ZNF137, Accession NM_003438) is another VGAM2530 host target gene. ZNF137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF137 BINDING SITE, designated SEQ ID:9494, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85688] Another function of VGAM2530 is therefore inhibition of Zinc Finger Protein 137 (clone pHZ-30) (ZNF137, Accession NM_003438). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF137. Arachidonate Lipoxygenase 3 (ALOXE3, Accession NM_021628) is another VGAM2530 host target gene. ALOXE3 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALOXE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALOXE3 BINDING SITE, designated SEQ ID:22266, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85689] Another function of VGAM2530 is therefore inhibition of Arachidonate Lipoxygenase 3 (ALOXE3, Accession NM_021628). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOXE3. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM2530 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:25402, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ

ID:5241.

[85690] Another function of VGAM2530 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. DKFZp434K2435 (Accession NM_032256) is another VGAM2530 host target gene. DKFZp434K2435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434K2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434K2435 BINDING SITE, designated SEQ ID:25999, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85691] Another function of VGAM2530 is therefore inhibition of DKFZp434K2435 (Accession NM_032256). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K2435. DKFZp761D0614 (Accession XM_113634) is another VGAM2530 host target gene. DK-

FZp761D0614 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761D0614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D0614 BINDING SITE, designated SEQ ID:42312, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85692] Another function of VGAM2530 is therefore inhibition of DKFZp761D0614 (Accession XM_113634). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D0614. Dynamin 1-like (DNM1L, Accession NM_012062) is another VGAM2530 host target gene. DNM1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNM1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNM1L BINDING SITE, designated SEQ ID:14318, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ

ID:5241.

[85693] Another function of VGAM2530 is therefore inhibition of Dynamin 1-like (DNM1L, Accession NM_012062). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNM1L. FLJ10482 (Accession NM_018107) is another VGAM2530 host target gene. FLJ10482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10482 BINDING SITE, designated SEQ ID:19877, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85694] Another function of VGAM2530 is therefore inhibition of FLJ10482 (Accession NM_018107). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10482. FLJ11142 (Accession NM_018338) is another VGAM2530 host target gene. FLJ11142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11142, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11142 BINDING SITE, designated SEQ ID:20345, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85695] Another function of VGAM2530 is therefore inhibition of FLJ11142 (Accession NM_018338). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11142. FLJ11722 (Accession NM_024970) is another VGAM2530 host target gene. FLJ11722 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11722 BINDING SITE, designated SEQ ID:24520, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85696] Another function of VGAM2530 is therefore inhibition of FLJ11722 (Accession NM_024970). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11722. FLJ23322 (Accession XM_114207) is another VGAM2530 host target gene. FLJ23322 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23322 BINDING SITE, designated SEQ ID:42800, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85697] Another function of VGAM2530 is therefore inhibition of FLJ23322 (Accession XM_114207). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23322. FLJ32356 (Accession NM_144671) is another VGAM2530 host target gene. FLJ32356 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32356 BINDING SITE, designated SEQ ID:29494, to the nucleotide

sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85698] Another function of VGAM2530 is therefore inhibition of FLJ32356 (Accession NM_144671). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32356. Forkhead Box O3A (FOXO3A, Accession NM_001455) is another VGAM2530 host target gene. FOXO3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXO3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO3A BINDING SITE, designated SEQ ID:7191, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85699] Another function of VGAM2530 is therefore inhibition of Forkhead Box O3A (FOXO3A, Accession NM_001455). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO3A. GREB1 (Accession XM_051545) is another VGAM2530 host target gene. GREB1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:35854, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85700] Another function of VGAM2530 is therefore inhibition of GREB1 (Accession XM_051545). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. H11 (Accession NM_014365) is another VGAM2530 host target gene. H11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H11 BINDING SITE, designated SEQ ID:15694, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85701] Another function of VGAM2530 is therefore inhibition of

H11 (Accession NM_014365). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H11. HERV-H LTR-associating 2 (HHLA2, Accession NM_007072) is another VGAM2530 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13940, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85702] Another function of VGAM2530 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM_007072). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. HSGP25L2G (Accession XM_030771) is another VGAM2530 host target gene. HSGP25L2G BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSGP25L2G, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSGP25L2G BINDING SITE, designated SEQ ID:31136, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85703] Another function of VGAM2530 is therefore inhibition of HSGP25L2G (Accession XM_030771). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSGP25L2G. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251) is another VGAM2530 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:8046, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85704] Another function of VGAM2530 is therefore inhibition of

Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KIAA0747 (Accession NM_015292) is another VGAM2530 host target gene. KIAA0747 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0747 BINDING SITE, designated SEQ ID:17613, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85705] Another function of VGAM2530 is therefore inhibition of KIAA0747 (Accession NM_015292). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0747. KIAA1190 (Accession XM_048695) is another VGAM2530 host target gene. KIAA1190 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1190, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1190 BINDING SITE, designated SEQ ID:35225, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85706] Another function of VGAM2530 is therefore inhibition of KIAA1190 (Accession XM_048695). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1190. KIAA1456 (Accession XM_040100) is another VGAM2530 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33265, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85707] Another function of VGAM2530 is therefore inhibition of KIAA1456 (Accession XM_040100). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1456. KIAA1813 (Accession XM_046743) is another VGAM2530 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34812, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85708] Another function of VGAM2530 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. MGC20255 (Accession NM_052848) is another VGAM2530 host target gene. MGC20255 BINDING SITE1 and MGC20255 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC20255, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20255 BINDING SITE1 and MGC20255 BINDING SITE2, designated SEQ ID:27431 and SEQ

ID:27430 respectively, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85709] Another function of VGAM2530 is therefore inhibition of MGC20255 (Accession NM_052848). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20255. MGC5590 (Accession NM_024058) is another VGAM2530 host target gene. MGC5590 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5590 BINDING SITE, designated SEQ ID:23496, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85710] Another function of VGAM2530 is therefore inhibition of MGC5590 (Accession NM_024058). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5590. NK4 (Accession NM_004221) is another VGAM2530 host target gene. NK4 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by NK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NK4 BINDING SITE, designated SEQ ID:10418, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85711] Another function of VGAM2530 is therefore inhibition of NK4 (Accession NM_004221). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NK4. PB1 (Accession NM_018165) is another VGAM2530 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19979, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85712] Another function of VGAM2530 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of

VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. PP3501 (Accession NM_021731) is another VGAM2530 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22334, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85713] Another function of VGAM2530 is therefore inhibition of PP3501 (Accession NM_021731). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP3501. PRO0659 (Accession NM_014138) is another VGAM2530 host target gene. PRO0659 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0659

BINDING SITE, designated SEQ ID:15406, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85714] Another function of VGAM2530 is therefore inhibition of PRO0659 (Accession NM_014138). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0659. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361) is another VGAM2530 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17661, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85715] Another function of VGAM2530 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with R3HDM. RBT1 (Accession NM_013368) is another VGAM2530 host target gene. RBT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBT1 BINDING SITE, designated SEQ ID:15013, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85716] Another function of VGAM2530 is therefore inhibition of RBT1 (Accession NM_013368). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBT1. RoXaN (Accession NM_025013) is another VGAM2530 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24604, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ

ID:5241.

[85717] Another function of VGAM2530 is therefore inhibition of RoXaN (Accession NM_025013). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. U5-100K (Accession XM_006784) is another VGAM2530 host target gene. U5-100K BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by U5-100K, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-100K BINDING SITE, designated SEQ ID:30012, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85718] Another function of VGAM2530 is therefore inhibition of U5-100K (Accession XM_006784). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-100K. ZAK (Accession NM_133646) is another VGAM2530 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28607, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85719] Another function of VGAM2530 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. ZER6 (Accession XM_032742) is another VGAM2530 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31745, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85720] Another function of VGAM2530 is therefore inhibition of ZER6 (Accession XM_032742). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ZER6. LOC138389 (Accession XM_072534) is another VGAM2530 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37508, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85721] Another function of VGAM2530 is therefore inhibition of LOC138389 (Accession XM_072534). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC145900 (Accession XM_085276) is another VGAM2530 host target gene. LOC145900 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145900 BINDING SITE, designated SEQ ID:38014, to

the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85722] Another function of VGAM2530 is therefore inhibition of LOC145900 (Accession XM_085276). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145900. LOC148137 (Accession NM_144692) is another VGAM2530 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29520, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85723] Another function of VGAM2530 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC148508 (Accession XM_097478) is another VGAM2530 host target gene. LOC148508 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC148508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148508 BINDING SITE, designated SEQ ID:40885, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85724] Another function of VGAM2530 is therefore inhibition of LOC148508 (Accession XM_097478). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148508. LOC148534 (Accession XM_086222) is another VGAM2530 host target gene. LOC148534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148534 BINDING SITE, designated SEQ ID:38551, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85725] Another function of VGAM2530 is therefore inhibition of LOC148534 (Accession XM_086222). Accordingly, utilities

of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148534. LOC148930 (Accession XM_086369) is another VGAM2530 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38620, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85726] Another function of VGAM2530 is therefore inhibition of LOC148930 (Accession XM_086369). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC149721 (Accession XM_086649) is another VGAM2530 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC149721 BINDING SITE, designated SEQ ID:38814, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85727] Another function of VGAM2530 is therefore inhibition of LOC149721 (Accession XM_086649). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. LOC150157 (Accession XM_097823) is another VGAM2530 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41143, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85728] Another function of VGAM2530 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC152972 (Accession XM_087572) is another VGAM2530 host target gene. LOC152972 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152972 BINDING SITE, designated SEQ ID:39346, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85729] Another function of VGAM2530 is therefore inhibition of LOC152972 (Accession XM_087572). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152972. LOC196890 (Accession XM_116951) is another VGAM2530 host target gene. LOC196890 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196890 BINDING SITE, designated SEQ ID:43155, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85730] Another function of VGAM2530 is therefore inhibition of

LOC196890 (Accession XM_116951). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196890. LOC200014 (Accession XM_114087) is another VGAM2530 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42696, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85731] Another function of VGAM2530 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC200853 (Accession XM_114308) is another VGAM2530 host target gene. LOC200853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC200853 BINDING SITE, designated SEQ ID:42869, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85732] Another function of VGAM2530 is therefore inhibition of LOC200853 (Accession XM_114308). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200853. LOC253805 (Accession XM_172854) is another VGAM2530 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46139, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85733] Another function of VGAM2530 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC90593 (Accession XM_032815) is an-

other VGAM2530 host target gene. LOC90593 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90593 BINDING SITE, designated SEQ ID:31767, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85734] Another function of VGAM2530 is therefore inhibition of LOC90593 (Accession XM_032815). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90593. LOC91516 (Accession XM_038924) is another VGAM2530 host target gene. LOC91516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91516 BINDING SITE, designated SEQ ID:32957, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85735] Another function of VGAM2530 is therefore inhibition of LOC91516 (Accession XM_038924). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91516. LOC92539 (Accession XM_045632) is another VGAM2530 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34506, to the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, also designated SEQ ID:5241.

[85736] Another function of VGAM2530 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2531 (VGAM2531) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[85737] VGAM2531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2531 was detected is described hereinabove with reference to Figs. 1-8.

[85738] VGAM2531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Ringspot Virus. VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85739] VGAM2531 gene encodes a VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2531 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2531 precursor RNA is designated SEQ ID:2517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2517 is located at position 2562 relative to the genome of Pepper Ringspot Virus.

[85740] VGAM2531 precursor RNA folds onto itself, forming VGAM2531 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85741] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2531 folded precursor RNA into VGAM2531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2531 RNA is designated SEQ ID:5242, and is provided hereinbelow with reference to the sequence listing part.

[85742] VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2531 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85743] VGAM2531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2531 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85744] The complementary binding of VGAM2531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2531 host target RNA into VGAM2531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85745] It is appreciated that VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2531 host target genes. The mRNA of each one of this plurality of VGAM2531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2531 RNA, herein designated VGAM RNA, and which when bound by VGAM2531 RNA causes inhibition of translation of respective one or more VGAM2531 host target proteins.

[85746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2531 gene, herein designated VGAM GENE, on one or more VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85747] It is yet further appreciated that a function of VGAM2531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of viral infection by Pepper Ringspot Virus. Specific functions, and accordingly utilities, of VGAM2531 correlate with, and may be deduced from, the identity of the host target genes which VGAM2531 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[85748] Nucleotide sequences of the VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2531 are further described hereinbelow with reference to Table 1.

[85749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2531 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85750] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2531 gene, herein designated VGAM is inhibition of expression of VGAM2531 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2531 correlate with, and may be deduced from, the identity of the target genes which VGAM2531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85751] Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564) is a VGAM2531 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26288, to the nucleotide sequence of VGAM2531 RNA, herein designated VGAM RNA, also designated SEQ ID:5242.

[85752] A function of VGAM2531 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564). Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260) is another VGAM2531 host target gene. HLA-DQA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HLA-DQA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of HLA-DQA1 BINDING SITE, designated SEQ ID:46725, to the nucleotide sequence of VGAM2531 RNA, herein designated VGAM RNA, also designated SEQ ID:5242.

[85753] Another function of VGAM2531 is therefore inhibition of Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260), a gene which is alpha 1 chain of HLA-DQ1 class II molecule (Ia antigen) which binds peptides and presents them to CD4+ T lymphocytes. Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-DQA1. The function of HLA-DQA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.FLJ00001 (Accession XM_088525) is another VGAM2531 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39788, to the nucleotide

sequence of VGAM2531 RNA, herein designated VGAM RNA, also designated SEQ ID:5242.

[85754] Another function of VGAM2531 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. LOC255042 (Accession XM_170896) is another VGAM2531 host target gene. LOC255042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:45647, to the nucleotide sequence of VGAM2531 RNA, herein designated VGAM RNA, also designated SEQ ID:5242.

[85755] Another function of VGAM2531 is therefore inhibition of LOC255042 (Accession XM_170896). Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2532 (VGAM2532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85756] VGAM2532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2532 was detected is described hereinabove with reference to Figs. 1-8.

[85757] VGAM2532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo Virus. VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85758] VGAM2532 gene encodes a VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2532 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2532 precursor RNA is designated SEQ ID:2518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2518 is located at position 643 relative to the genome of Rio Bravo Virus.

[85759] VGAM2532 precursor RNA folds onto itself, forming VGAM2532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85760] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2532 folded precursor RNA into VGAM2532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2532 RNA is designated SEQ ID:5243, and is provided hereinbelow with reference to the sequence listing part.

[85761] VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2532 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2532 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85762] VGAM2532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2532 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85763] The complementary binding of VGAM2532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2532 host target RNA into VGAM2532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85764] It is appreciated that VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2532 host target genes. The mRNA of each one of this plurality of VGAM2532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2532 RNA, herein designated VGAM RNA, and which when bound by VGAM2532 RNA causes inhibition of translation of respective one or more VGAM2532 host target proteins.

[85765] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2532 gene, herein designated VGAM GENE, on one or more VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85766] It is yet further appreciated that a function of VGAM2532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2532 include diagnosis, prevention and treatment of viral infection by Rio Bravo Virus. Specific functions, and accordingly utilities, of VGAM2532 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85767] Nucleotide sequences of the VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2532 are further described hereinbelow with reference to Table 1.

[85768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2532 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85769] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2532 gene, herein designated VGAM is inhibition of expression of VGAM2532 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2532 correlate with, and may be deduced from, the identity of the target genes which VGAM2532

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85770] BRAG (Accession NM_014863) is a VGAM2532 host target gene. BRAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRAG BINDING SITE, designated SEQ ID:16939, to the nucleotide sequence of VGAM2532 RNA, herein designated VGAM RNA, also designated SEQ ID:5243.

[85771] A function of VGAM2532 is therefore inhibition of BRAG (Accession NM_014863). Accordingly, utilities of VGAM2532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRAG. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2533 (VGAM2533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85772] VGAM2533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2533 was detected is described hereinabove with reference to Figs. 1-8.

[85773] VGAM2533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo Virus. VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85774] VGAM2533 gene encodes a VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2533 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2533 precursor RNA is designated SEQ ID:2519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2519 is located at position 3063 relative to the genome of Rio Bravo Virus.

[85775] VGAM2533 precursor RNA folds onto itself, forming VGAM2533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85776] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2533 folded precursor RNA into VGAM2533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2533 RNA is designated SEQ ID:5244, and is provided hereinbelow with reference to the sequence listing part.

[85777] VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2533 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85778] VGAM2533 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2533 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85779] The complementary binding of VGAM2533 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2533 host target RNA into VGAM2533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85780] It is appreciated that VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2533 host target genes. The mRNA of each one of this plurality of VGAM2533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2533 RNA, herein designated VGAM RNA, and which when bound by VGAM2533 RNA causes inhibition of translation of respective one or more VGAM2533 host target proteins.

[85781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2533 gene, herein designated VGAM GENE, on one or more VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85782] It is yet further appreciated that a function of VGAM2533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of viral infection by Rio Bravo Virus. Specific functions, and accordingly utilities, of VGAM2533 correlate with, and may be deduced from, the identity of the host target genes which VGAM2533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85783] Nucleotide sequences of the VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2533 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2533 are further described hereinbelow with reference to Table 1.

[85784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2533 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85785] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2533 gene, herein designated VGAM is inhibition of expression of VGAM2533 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2533 correlate with, and may be deduced from, the identity of the target genes which VGAM2533 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85786] CRACC (Accession NM_021181) is a VGAM2533 host target gene. CRACC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRACC, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRACC BINDING SITE, designated SEQ ID:22153, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85787] A function of VGAM2533 is therefore inhibition of CRACC (Accession NM_021181), a gene which may participate in adhesion reactions between t lymphocytes and accessory cells. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRACC. The function of CRACC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26.Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM_002224) is another VGAM2533 host target gene. ITPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:7997,

to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85788] Another function of VGAM2533 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310.Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293) is another VGAM2533 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8079, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85789] Another function of VGAM2533 is therefore inhibition of

Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM812.LFG (Accession XM_084780) is another VGAM2533 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37688, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85790] Another function of VGAM2533 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Protein Tyrosine Phosphatase, Receptor Type, N (PTPRN,

Accession NM_002846) is another VGAM2533 host target gene. PTPRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN BINDING SITE, designated SEQ ID:8734, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85791] Another function of VGAM2533 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N (PTPRN, Accession NM_002846). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN. Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553) is another VGAM2533 host target gene. RBBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ

ID:34741, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85792] Another function of VGAM2533 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647) is another VGAM2533 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12182, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85793] Another function of VGAM2533 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM_017489) is another VGAM2533 host target gene. TERF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF1 BINDING SITE, designated SEQ ID:18951, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85794] Another function of VGAM2533 is therefore inhibition of Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM_017489), a gene which negatively regulates telomere length, involves in regulation of the mitotic spindle. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF1. The function of TERF1 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM189.Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM2533 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15360, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85795] Another function of VGAM2533 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Williams-Beuren Syndrome Chromosome Re-

gion 1 (WBSCR1, Accession NM_022170) is another VGAM2533 host target gene. WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:22724 and SEQ ID:25707 respectively, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85796] Another function of VGAM2533 is therefore inhibition of Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170), a gene which stimulates protein translation. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.Cytoskeleton Associated Protein 2 (CKAP2, Accession NM_018204) is another VGAM2533

host target gene. CKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP2 BINDING SITE, designated SEQ ID:20089, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85797] Another function of VGAM2533 is therefore inhibition of Cytoskeleton Associated Protein 2 (CKAP2, Accession NM_018204). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP2. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989) is another VGAM2533 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:15169 and SEQ ID:6458 respectively, to

the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85798] Another function of VGAM2533 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. FLJ10702 (Accession NM_018184) is another VGAM2533 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10702 BINDING SITE, designated SEQ ID:20026, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85799] Another function of VGAM2533 is therefore inhibition of FLJ10702 (Accession NM_018184). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. FLJ11117 (Accession NM_018329) is another VGAM2533 host target gene. FLJ11117 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11117 BINDING SITE, designated SEQ ID:20326, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85800] Another function of VGAM2533 is therefore inhibition of FLJ11117 (Accession NM_018329). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11117. KIAA0295 (Accession XM_042833) is another VGAM2533 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33781, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85801] Another function of VGAM2533 is therefore inhibition of

KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0836 (Accession XM_035390) is another VGAM2533 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32249, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85802] Another function of VGAM2533 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM_017724) is another VGAM2533 host target gene. LRRFIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRRFIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP2 BINDING SITE, designated SEQ ID:19314, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85803] Another function of VGAM2533 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM_017724). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP2. PGS1 (Accession NM_024419) is another VGAM2533 host target gene. PGS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PGS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGS1 BINDING SITE, designated SEQ ID:23658, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85804] Another function of VGAM2533 is therefore inhibition of PGS1 (Accession NM_024419). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PGS1. Stathmin-like 3 (STMN3, Accession NM_015894) is another VGAM2533 host target gene. STMN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STMN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN3 BINDING SITE, designated SEQ ID:18040, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85805] Another function of VGAM2533 is therefore inhibition of Stathmin-like 3 (STMN3, Accession NM_015894). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN3. TACTILE (Accession NM_005816) is another VGAM2533 host target gene. TACTILE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACTILE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE BINDING SITE, designated SEQ ID:12415, to the nucleotide

sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85806] Another function of VGAM2533 is therefore inhibition of TACTILE (Accession NM_005816). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020553) is another VGAM2533 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:21777 and SEQ ID:21779 respectively, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85807] Another function of VGAM2533 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020553). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC152620

(Accession XM_011108) is another VGAM2533 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30171, to the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, also designated SEQ ID:5244.

[85808] Another function of VGAM2533 is therefore inhibition of LOC152620 (Accession XM_011108). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC158668 (Accession XM_045161) is another VGAM2533 host target gene. LOC158668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158668 BINDING SITE, designated SEQ ID:34376, to the nucleotide sequence of VGAM2533 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5244.

[85809] Another function of VGAM2533 is therefore inhibition of LOC158668 (Accession XM_045161). Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158668. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2534 (VGAM2534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85810] VGAM2534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2534 was detected is described hereinabove with reference to Figs. 1-8.

[85811] VGAM2534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo Virus. VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85812] VGAM2534 gene encodes a VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2534 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2534 precursor RNA is designated SEQ ID:2520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2520 is located at position 7314 relative to the genome of Rio Bravo Virus.

[85813] VGAM2534 precursor RNA folds onto itself, forming VGAM2534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85814] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2534 folded precursor RNA into VGAM2534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2534 RNA is designated SEQ ID:5245, and is provided hereinbelow with reference to the sequence listing part.

[85815] VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2534 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85816] VGAM2534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2534 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85817] The complementary binding of VGAM2534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2534 host target RNA into VGAM2534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85818] It is appreciated that VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2534 host target genes. The mRNA of

each one of this plurality of VGAM2534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2534 RNA, herein designated VGAM RNA, and which when bound by VGAM2534 RNA causes inhibition of translation of respective one or more VGAM2534 host target proteins.

[85819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2534 gene, herein designated VGAM GENE, on one or more VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[85820] It is yet further appreciated that a function of VGAM2534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of viral infection by Rio Bravo Virus. Specific functions, and accordingly utilities, of VGAM2534 correlate with, and may be deduced from, the identity of the host target genes which VGAM2534 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85821] Nucleotide sequences of the VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2534 are further described hereinbelow with reference to Table 1.

[85822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2534 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2534 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85823] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2534 gene, herein designated VGAM is inhibition of expression of VGAM2534 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2534 correlate with, and may be deduced from, the identity of the target genes which VGAM2534 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85824] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781) is a VGAM2534 host target gene. B3GALT3 BINDING SITE1 through B3GALT3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE1 through B3GALT3 BINDING SITE3, designated SEQ ID:9866, SEQ ID:27015 and SEQ ID:27018 respectively, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85825] A function of VGAM2534 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. Fibroblast Growth Factor 1 (acidic) (FGF1, Accession NM_033137) is another VGAM2534 host target gene. FGF1 BINDING SITE1 through FGF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF1 BINDING SITE1 through FGF1 BINDING SITE3, designated SEQ ID:26988, SEQ ID:26986 and SEQ ID:6469 respectively, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85826] Another function of VGAM2534 is therefore inhibition of Fibroblast Growth Factor 1 (acidic) (FGF1, Accession NM_033137), a gene which potent mitogen for a variety of cell types. Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF1. The function of FGF1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080550) is another VGAM2534 host target gene. AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP1GBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3, designated SEQ ID:27869, SEQ ID:27875 and SEQ ID:24616 respectively, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85827] Another function of VGAM2534 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080550). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. KIAA1260 (Accession XM_010461) is another VGAM2534 host target gene. KIAA1260 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by KIAA1260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1260 BINDING SITE, designated SEQ ID:30155, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85828] Another function of VGAM2534 is therefore inhibition of KIAA1260 (Accession XM_010461). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1260. Stromal Interaction Molecule 2 (STIM2, Accession NM_020860) is another VGAM2534 host target gene. STIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM2 BINDING SITE, designated SEQ ID:21913, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85829] Another function of VGAM2534 is therefore inhibition of Stromal Interaction Molecule 2 (STIM2, Accession NM_020860). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIM2. LOC130752 (Accession XM_059468) is another VGAM2534 host target gene. LOC130752 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130752 BINDING SITE, designated SEQ ID:37005, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85830] Another function of VGAM2534 is therefore inhibition of LOC130752 (Accession XM_059468). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130752. LOC157869 (Accession XM_088409) is another VGAM2534 host target gene. LOC157869 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157869, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157869 BINDING SITE, designated SEQ ID:39674, to the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, also designated SEQ ID:5245.

[85831] Another function of VGAM2534 is therefore inhibition of LOC157869 (Accession XM_088409). Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157869. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2535 (VGAM2535) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85832] VGAM2535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2535 was detected is described hereinabove with reference to Figs. 1-8.

[85833] VGAM2535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo Virus.

VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85834] VGAM2535 gene encodes a VGAM2535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2535 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2535 precursor RNA is designated SEQ ID:2521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2521 is located at position 5612 relative to the genome of Rio Bravo Virus.

[85835] VGAM2535 precursor RNA folds onto itself, forming VGAM2535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85836] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2535 folded precursor RNA into VGAM2535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2535 RNA is designated SEQ ID:5246, and is provided hereinbelow with reference to the sequence listing part.

[85837] VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2535 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85838] VGAM2535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2535 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85839] The complementary binding of VGAM2535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2535 host target RNA into VGAM2535 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85840] It is appreciated that VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2535 host target genes. The mRNA of each one of this plurality of VGAM2535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2535 RNA, herein designated VGAM RNA, and which when bound by VGAM2535 RNA causes inhibition of translation of respective one or more VGAM2535 host target proteins.

[85841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2535 gene, herein designated VGAM GENE, on one or more VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85842] It is yet further appreciated that a function of VGAM2535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of viral infection by Rio Bravo Virus. Specific functions, and accordingly utilities, of VGAM2535 correlate with, and may be deduced from, the identity of the host target genes which VGAM2535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85843] Nucleotide sequences of the VGAM2535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2535 are further described hereinbelow with reference to Table 1.

[85844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2535 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2535 gene, herein designated VGAM is inhibition of expression of VGAM2535 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2535 correlate with, and may be deduced from, the identity of the target genes which VGAM2535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85846] Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM_032976) is a VGAM2535 host target gene. CASP10 BINDING SITE1 and CASP10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP10

BINDING SITE1 and CASP10 BINDING SITE2, designated SEQ ID:26833 and SEQ ID:26836 respectively, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85847] A function of VGAM2535 is therefore inhibition of Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM_032976), a gene which is one aspartate-specific cysteine protease and important in death receptor signaling or other cellular processes. Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP10. The function of CASP10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.CPEB1 (Accession NM_030594) is another VGAM2535 host target gene. CPEB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPEB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPEB1 BINDING SITE, designated SEQ ID:24959, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA,

also designated SEQ ID:5246.

[85848] Another function of VGAM2535 is therefore inhibition of CPEB1 (Accession NM_030594). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPEB1. Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255) is another VGAM2535 host target gene. FAM8A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FAM8A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM8A1 BINDING SITE, designated SEQ ID:18384, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85849] Another function of VGAM2535 is therefore inhibition of Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM8A1. FLJ20280 (Accession NM_017741) is another VGAM2535 host target gene. FLJ20280 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20280 BINDING SITE, designated SEQ ID:19332, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85850] Another function of VGAM2535 is therefore inhibition of FLJ20280 (Accession NM_017741). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20280. KIAA0350 (Accession XM_028332) is another VGAM2535 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30668, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85851] Another function of VGAM2535 is therefore inhibition of

KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0469 (Accession NM_014851) is another VGAM2535 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16895, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85852] Another function of VGAM2535 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA1117 (Accession XM_028219) is another VGAM2535 host target gene. KIAA1117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1117 BINDING SITE, designated SEQ ID:30633, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85853] Another function of VGAM2535 is therefore inhibition of KIAA1117 (Accession XM_028219). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1117. KIAA1128 (Accession XM_043596) is another VGAM2535 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33972, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85854] Another function of VGAM2535 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. Microtubule-actin Crosslinking Factor 1

(MACF1, Accession NM_012090) is another VGAM2535 host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:14378, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85855] Another function of VGAM2535 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_012090). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. LOC157273 (Accession XM_098743) is another VGAM2535 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41784, to the nucleotide sequence of

VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85856] Another function of VGAM2535 is therefore inhibition of LOC157273 (Accession XM_098743). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC202020 (Accession XM_114419) is another VGAM2535 host target gene. LOC202020 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202020 BINDING SITE, designated SEQ ID:42955, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85857] Another function of VGAM2535 is therefore inhibition of LOC202020 (Accession XM_114419). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202020. LOC253250 (Accession XM_170646) is another VGAM2535 host target gene. LOC253250 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC253250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253250 BINDING SITE, designated SEQ ID:45427, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85858] Another function of VGAM2535 is therefore inhibition of LOC253250 (Accession XM_170646). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253250. LOC257106 (Accession XM_170910) is another VGAM2535 host target gene. LOC257106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257106 BINDING SITE, designated SEQ ID:45680, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85859] Another function of VGAM2535 is therefore inhibition of LOC257106 (Accession XM_170910). Accordingly, utilities

of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257106. LOC257463 (Accession XM_048605) is another VGAM2535 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35211, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85860] Another function of VGAM2535 is therefore inhibition of LOC257463 (Accession XM_048605). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. LOC57826 (Accession NM_021183) is another VGAM2535 host target gene. LOC57826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC57826 BINDING SITE, designated SEQ ID:22160, to the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, also designated SEQ ID:5246.

[85861] Another function of VGAM2535 is therefore inhibition of LOC57826 (Accession NM_021183). Accordingly, utilities of VGAM2535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2536 (VGAM2536) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85862] VGAM2536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2536 was detected is described hereinabove with reference to Figs. 1-8.

[85863] VGAM2536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Reindeer-1. VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[85864] VGAM2536 gene encodes a VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2536 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2536 precursor RNA is designated SEQ ID:2522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2522 is located at position 4448 relative to the genome of Pestivirus Reindeer-1.

[85865] VGAM2536 precursor RNA folds onto itself, forming VGAM2536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85866] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2536 folded precursor RNA into VGAM2536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2536 RNA is designated SEQ ID:5247, and is provided hereinbelow with reference to the sequence listing part.

[85867] VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2536 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85868] VGAM2536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2536 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2536 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85869] The complementary binding of VGAM2536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2536 host target RNA into VGAM2536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[85870] It is appreciated that VGAM2536 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2536 host target genes. The mRNA of each one of this plurality of VGAM2536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2536 RNA, herein designated VGAM RNA, and which when bound by VGAM2536 RNA causes inhibition of translation of respective one or more VGAM2536 host target proteins.

[85871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2536 gene, herein designated VGAM GENE, on one or more VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85872] It is yet further appreciated that a function of VGAM2536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2536 include diagnosis, prevention and treatment of viral infection by Pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2536 correlate with, and may be deduced from, the identity of the host target genes which VGAM2536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85873] Nucleotide sequences of the VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2536 are further described hereinbelow with reference to Table 1.

[85874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2536 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85875] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2536 gene, herein designated VGAM is inhibition of expression of VGAM2536 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2536 correlate with, and may be deduced from, the identity of the target genes which VGAM2536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85876] UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474) is a VGAM2536 host target gene. GALNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT1 BINDING SITE, designated SEQ ID:21725, to the nucleotide sequence of VGAM2536 RNA, herein designated VGAM RNA, also designated SEQ

ID:5247.

[85877] A function of VGAM2536 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474), a gene which transfers an N-acetyl galactosamine (GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM2536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT1. The function of GALNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.FLJ12787 (Accession NM_032175) is another VGAM2536 host target gene. FLJ12787 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12787, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12787 BINDING SITE, designated SEQ ID:25890, to the nucleotide sequence of VGAM2536 RNA, herein designated VGAM RNA, also designated SEQ ID:5247.

[85878] Another function of VGAM2536 is therefore inhibition of FLJ12787 (Accession NM_032175). Accordingly, utilities of VGAM2536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12787. SV2B (Accession NM_014848) is another VGAM2536 host target gene. SV2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SV2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2B BINDING SITE, designated SEQ ID:16880, to the nucleotide sequence of VGAM2536 RNA, herein designated VGAM RNA, also designated SEQ ID:5247.

[85879] Another function of VGAM2536 is therefore inhibition of SV2B (Accession NM_014848). Accordingly, utilities of VGAM2536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2B. TA-PP2C (Accession NM_139283) is another VGAM2536 host target gene. TA-PP2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TA-PP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:29284, to the nucleotide sequence of VGAM2536 RNA, herein designated VGAM RNA, also designated SEQ ID:5247.

[85880] Another function of VGAM2536 is therefore inhibition of TA-PP2C (Accession NM_139283). Accordingly, utilities of VGAM2536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2537 (VGAM2537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[85881] VGAM2537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2537 was detected is described hereinabove with reference to Figs. 1-8.

[85882] VGAM2537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Reindeer-1. VGAM2537 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[85883] VGAM2537 gene encodes a VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2537 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2537 precursor RNA is designated SEQ ID:2523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2523 is located at position 4253 relative to the genome of Pestivirus Reindeer-1.

[85884] VGAM2537 precursor RNA folds onto itself, forming VGAM2537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[85885] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2537 folded precursor RNA into VGAM2537

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2537 RNA is designated SEQ ID:5248, and is provided hereinbelow with reference to the sequence listing part.

[85886] VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2537 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[85887] VGAM2537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2537 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2537 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[85888] The complementary binding of VGAM2537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2537 host target RNA into VGAM2537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[85889] It is appreciated that VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2537 host target genes. The mRNA of each one of this plurality of VGAM2537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2537 RNA, herein designated VGAM RNA, and which when bound by VGAM2537 RNA causes inhibition of translation of respective one or more VGAM2537 host target proteins.

[85890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2537 gene, herein designated VGAM GENE, on one or more VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[85891] It is yet further appreciated that a function of VGAM2537 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of viral infection by Pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2537 correlate with, and may be deduced from, the identity of the host target genes which VGAM2537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[85892] Nucleotide sequences of the VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2537 are further described hereinbelow with reference to Table 1.

[85893] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2537 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[85894] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2537 gene, herein designated VGAM is inhibition of expression of VGAM2537 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2537 correlate with, and may be deduced from, the identity of the target genes which VGAM2537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[85895] Agrin (AGRN, Accession XM_086178) is a VGAM2537 host target gene. AGRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AGRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGRN BINDING SITE, designated SEQ ID:38535, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ

ID:5248.

[85896] A function of VGAM2537 is therefore inhibition of Agrin (AGRN, Accession XM_086178), a gene which a neuronal aggregating factor that induces the aggregation of acetylcholine receptors . Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGRN. The function of AGRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is another VGAM2537 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:30281, SEQ ID:5477 and SEQ ID:21730 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85897] Another function of VGAM2537 is therefore inhibition of

Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Androgen Receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy; Kennedy disease) (AR, Accession NM_000044) is another VGAM2537 host target gene. AR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AR BINDING SITE, designated SEQ ID:5486, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85898] Another function of VGAM2537 is therefore inhibition of Androgen Receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy; Kennedy disease) (AR, Accession NM_000044), a gene which are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with AR. The function of AR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1971.ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is another VGAM2537 host target gene. ATP1B2 BINDING SITE1 and ATP1B2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATP1B2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE1 and ATP1B2 BINDING SITE2, designated SEQ ID:7390 and SEQ ID:7391 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85899] Another function of VGAM2537 is therefore inhibition of ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of VGAM2537 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is another VGAM2537 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23160, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85900] Another function of VGAM2537 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_138931) is another VGAM2537 host target gene. BCL6 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by BCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:29056, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85901] Another function of VGAM2537 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_138931), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Breakpoint Cluster Region (BCR, Accession NM_021574) is another VGAM2537 host target gene. BCR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCR, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCR BINDING SITE, designated SEQ ID:22237, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85902] Another function of VGAM2537 is therefore inhibition of Breakpoint Cluster Region (BCR, Accession NM_021574), a gene which is a serine/threonine kinase that involves in the t(9;22) translocation (Philadelphia chromosome). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCR. The function of BCR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2151.BTG Family, Member 2 (BTG2, Accession NM_006763) is another VGAM2537 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13626, to the nucleotide sequence of VGAM2537

RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85903] Another function of VGAM2537 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM_001736) is another VGAM2537 host target gene. C5R1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5R1 BINDING SITE, designated SEQ ID:7474, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85904] Another function of VGAM2537 is therefore inhibition of Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM_001736), a gene which has a nonredundant function and is required for mucosal host cell defense in the lung. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with C5R1. The function of C5R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM484.CD8 Antigen, Alpha Polypeptide (p32) (CD8A, Accession NM_001768) is another VGAM2537 host target gene. CD8A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD8A BINDING SITE, designated SEQ ID:7529, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85905] Another function of VGAM2537 is therefore inhibition of CD8 Antigen, Alpha Polypeptide (p32) (CD8A, Accession NM_001768), a gene which is thought to play a role in the process of t-cell mediated killing. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8A. The function of CD8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM609.Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM_078467) is another VGAM2537 host target gene. CDKN1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDKN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1A BINDING SITE, designated SEQ ID:27780, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85906] Another function of VGAM2537 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM_078467), a gene which inhibits cyclin-kinase activity and probably serves as the effector of p53 cell cycle control. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1A. The function of CDKN1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1912.Clock Homolog (mouse) (CLOCK, Accession NM_004898) is another VGAM2537 host target

gene. CLOCK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLOCK BINDING SITE, designated SEQ ID:11333, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85907] Another function of VGAM2537 is therefore inhibition of Clock Homolog (mouse) (CLOCK, Accession NM_004898). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLOCK. Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403) is another VGAM2537 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32255, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM

RNA, also designated SEQ ID:5248.

[85908] Another function of VGAM2537 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B. The function of CORO2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM_001883) is another VGAM2537 host target gene. CRHR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:7611, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85909] Another function of VGAM2537 is therefore inhibition of Corticotropin Releasing Hormone Receptor 2 (CRHR2, Ac-

cession NM_001883), a gene which is a corticotropin releasing factor receptor type II. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR2. The function of CRHR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737.C-src Tyrosine Kinase (CSK, Accession NM_004383) is another VGAM2537 host target gene. CSK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CSK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSK BINDING SITE, designated SEQ ID:10608, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85910] Another function of VGAM2537 is therefore inhibition of C-src Tyrosine Kinase (CSK, Accession NM_004383), a gene which down-regulates antigen receptor signaling in T lymphocytes and the c-src oncoprotein. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CSK. The function of CSK has been established by previous studies. Partanen et al. (1991) cloned a novel cytoplasmic tyrosine kinase designated CSK. This tyrosine kinase was shown to downregulate the tyrosine kinase activity of the c-src oncoprotein (OMIM Ref. No. 190090) through tyrosine phosphorylation of the c-src carboxy terminus. Since cell transformation by SRC oncoproteins is caused by various mechanisms that interfere with this phosphorylation, the CSK gene might function as an antioncogene (Armstrong et al., 1992). The CSK gene is ubiquitously expressed in human tissues as 2 mRNA species of 2.6 and 3.4 kb, although in some tissues and cell lines, only the larger mRNA is detected Cloutier and Veillette (1996) used the yeast 2-hybrid system to identify proteins associated with CSK. They found that the Src homology-3 (SH3) domain of CSK associates with a proline-rich region of PEP (OMIM Ref. No. 600716), a protein-tyrosine phosphatase expressed in hemopoietic cells. Cloutier and Veillette (1996) showed that this association is highly specific and speculated that PEP may be an effector and/or regulator of CSK in T cells and other hemopoietic cells

[85911] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[85912] Armstrong, E.; Cannizzaro, L.; Bergman, M.; Huebner, K.; Alitalo, K. : The c-src tyrosine kinase (CSK) gene, a potential antioncogene, localizes to human chromosome region 15q23-q25. Cytogenet. Cell Genet. 60: 119-120, 1992. ; and

[85913] Cloutier, J.-F.; Veillette, A. : Association of inhibitory tyrosine protein kinase p50(csk) with protein tyrosine phosphatase PEP in T cells and other hemopoietic cells. EMBO J. 15: 4909.

[85914] Further studies establishing the function and utilities of CSK are found in John Hopkins OMIM database record ID 124095, and in sited publications numbered 3685-3687 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Drebrin 1 (DBN1, Accession NM_004395) is another VGAM2537 host target gene. DBN1 BINDING SITE1 and DBN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DBN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBN1 BINDING SITE1

and DBN1 BINDING SITE2, designated SEQ ID:10639 and SEQ ID:28122 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85915] Another function of VGAM2537 is therefore inhibition of Drebrin 1 (DBN1, Accession NM_004395). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBN1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, S. cerevisiae) (DDX11, Accession NM_004399) is another VGAM2537 host target gene. DDX11 BINDING SITE1 and DDX11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE1 and DDX11 BINDING SITE2, designated SEQ ID:10652 and SEQ ID:13561 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85916] Another function of VGAM2537 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11

(CHL1-like helicase homolog, S. cerevisiae) (DDX11, Accession NM_004399), a gene which could be an ATP-dependent DNA-binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11. The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533.Doublesex and Mab-3 Related Transcription Factor 2 (DMRT2, Accession NM_006557) is another VGAM2537 host target gene. DMRT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMRT2 BINDING SITE, designated SEQ ID:13323, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85917] Another function of VGAM2537 is therefore inhibition of Doublesex and Mab-3 Related Transcription Factor 2 (DMRT2, Accession NM_006557), a gene which May be in-

volved in male sexual development. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMRT2. The function of DMRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Dual Specificity Phosphatase 4 (DUSP4, Accession NM_057158) is another VGAM2537 host target gene. DUSP4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DUSP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP4 BINDING SITE, designated SEQ ID:27667, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85918] Another function of VGAM2537 is therefore inhibition of Dual Specificity Phosphatase 4 (DUSP4, Accession NM_057158), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP4. The function of

DUSP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.ELK1, Member of ETS Oncogene Family (ELK1, Accession NM_005229) is another VGAM2537 host target gene. ELK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK1 BINDING SITE, designated SEQ ID:11732, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85919] Another function of VGAM2537 is therefore inhibition of ELK1, Member of ETS Oncogene Family (ELK1, Accession NM_005229), a gene which stimulates transcription. can form a ternary complex with the serum response factor and the ets and srf motifs of the fos serum response element. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELK1. The function of ELK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM178.Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is another VGAM2537 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32998, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85920] Another function of VGAM2537 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.Fibroblast Growth Factor 12 (FGF12, Accession NM_021032) is another VGAM2537 host target gene. FGF12 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by FGF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF12 BINDING SITE, designated SEQ ID:22019, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85921] Another function of VGAM2537 is therefore inhibition of Fibroblast Growth Factor 12 (FGF12, Accession NM_021032), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF12. The function of FGF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1025.FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003) is another VGAM2537 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22550, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85922] Another function of VGAM2537 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD6. Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990) is another VGAM2537 host target gene. GABRE BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GABRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE, designated SEQ ID:22529, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85923] Another function of VGAM2537 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon

(GABRE, Accession NM_021990), a gene which mediates neuronal inhibition by binding to the gaba/ benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512) is another VGAM2537 host target gene. GALNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNS BINDING SITE, designated SEQ ID:6124, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85924] Another function of VGAM2537 is therefore inhibition of Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio

syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNS. Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062) is another VGAM2537 host target gene. GLP1R BINDING SITE1 and GLP1R BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GLP1R, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE1 and GLP1R BINDING SITE2, designated SEQ ID:7822 and SEQ ID:7823 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85925] Another function of VGAM2537 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652.G Protein-coupled Receptor 45 (GPR45, Accession NM_007227) is another VGAM2537 host target gene. GPR45 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR45 BINDING SITE, designated SEQ ID:14094, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85926] Another function of VGAM2537 is therefore inhibition of G Protein-coupled Receptor 45 (GPR45, Accession NM_007227). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR45. Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM_004494) is another VGAM2537 host target gene. HDGF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDGF, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDGF BINDING SITE, designated SEQ ID:10832, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85927] Another function of VGAM2537 is therefore inhibition of Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM_004494), a gene which is a heparin-binding protein, with mitogenic activity for fibroblasts. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDGF. The function of HDGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Hippocalcin-like 1 (HPCAL1, Accession NM_002149) is another VGAM2537 host target gene. HPCAL1 BINDING SITE1 through HPCAL1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING

SITE1 through HPCAL1 BINDING SITE3, designated SEQ ID:7927, SEQ ID:28635 and SEQ ID:28634 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85928] Another function of VGAM2537 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_002149). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. Insulin-like Growth Factor Binding Protein 4 (IGFBP4, Accession NM_001552) is another VGAM2537 host target gene. IGFBP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IGFBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP4 BINDING SITE, designated SEQ ID:7275, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85929] Another function of VGAM2537 is therefore inhibition of Insulin-like Growth Factor Binding Protein 4 (IGFBP4, Accession NM_001552), a gene which prolongs the half-life of the igfs and inhibit or stimulate their growth promoting

effects on cell culture. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP4. The function of IGFBP4 has been established by previous studies. Six structurally distinct insulin-like growth factor binding proteins have been isolated and their cDNAs cloned: IGFBP1 (OMIM Ref. No. 146730), IGFBP2 (OMIM Ref. No. 146731), IGFBP3 (OMIM Ref. No. 146732), IGFBP4, IGFBP5 (OMIM Ref. No. 146734), and IGFBP6 (OMIM Ref. No. 146735). The proteins display strong sequence homologies, suggesting that they are encoded by a closely related family of genes. The IGFBPs contain 3 structurally distinct domains each comprising approximately one-third of the molecule. The N-terminal domain 1 and the C-terminal domain 3 of the 6 human IGFBPs show moderate to high levels of sequence identity including 12 and 6 invariant cysteine residues in domains 1 and 3, respectively (IGFBP6 contains 10 cysteine residues in domain 1), and are thought to be the IGF binding domains. Domain 2 is defined primarily by a lack of sequence identity among the 6 IGFBPs and by a lack of cysteine residues, though it does contain 2 cysteines in IGFBP4. Domain 3 is homologous to the thyroglobulin type I repeat unit. Kiefer et al. (1992)

characterized recombinant human insulin-like growth factor binding proteins 4, 5, and 6 by their expression in yeast as fusion proteins with ubiquitin (OMIM Ref. No. 191320). Results of the study suggested to the authors that the primary effect of the 3 proteins is the attenuation of IGF activity and suggested that they contribute to the control of IGF-mediated cell growth and metabolism. Based on peptide sequences of a purified insulin-like growth factor-binding protein (IGFBP), Shimasaki et al. (1990) cloned rat IGFBP4 using PCR. They used the rat cDNA to clone the human ortholog from a liver cDNA library. Human IGFBP4 encodes a 258-amino acid polypeptide, which includes a 21-amino acid signal sequence. The protein is very hydrophilic, which may facilitate its ability as a carrier protein for the IGFs in blood. Northern blot analysis of rat tissues revealed expression in all tissues examined, with highest expression in liver. Shimasaki et al. (1990) stated that IGFBP4 acts as an inhibitor of IGF-induced bone cell proliferation.

[85930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85931] Shimasaki, S.; Uchiyama, F.; Shimonaka, M.; Ling, N. :

Molecular cloning of the cDNAs encoding a novel insulin-like growth factor-binding protein from rat and human. Molec. Endocr. 4: 1451-1458, 1990. ; and

[85932] Kiefer, M. C.; Schmid, C.; Waldvogel, M.; Schlapfer, I.; Futo, E.; Masiarz, F. R.; Green, K.; Barr, P. J.; Zapf, J. : Characterization of recombinant human insulin-like growth factor bin.

[85933] Further studies establishing the function and utilities of IGFBP4 are found in John Hopkins OMIM database record ID 146733, and in sited publications numbered 3023-3027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634) is another VGAM2537 host target gene. IL8RA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL8RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8RA BINDING SITE, designated SEQ ID:6266, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85934] Another function of VGAM2537 is therefore inhibition of

Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634), a gene which is the receptor to interleukin-8, which is a powerful neutrophils chemotactic factor. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8RA. The function of IL8RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM300.Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM_012282) is another VGAM2537 host target gene. KCNE1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNE1L BINDING SITE, designated SEQ ID:14614, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85935] Another function of VGAM2537 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM_012282), a gene

which is a potassium voltage-gated channel. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE1L. The function of KCNE1L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_016611) is another VGAM2537 host target gene. KCNK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:18716, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85936] Another function of VGAM2537 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_016611). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of

Sylvius 1, MASA (mental retardation, aphasia, shuffling gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM_024003) is another VGAM2537 host target gene. L1CAM BINDING SITE1 and L1CAM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by L1CAM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L1CAM BINDING SITE1 and L1CAM BINDING SITE2, designated SEQ ID:23429 and SEQ ID:6001 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85937] Another function of VGAM2537 is therefore inhibition of L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of Sylvius 1, MASA (mental retardation, aphasia, shuffling gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM_024003). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L1CAM. MAX Binding Protein (MNT, Accession NM_020310) is another VGAM2537 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21560, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85938] Another function of VGAM2537 is therefore inhibition of MAX Binding Protein (MNT, Accession NM_020310). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Myotubularin Related Protein 3 (MTMR3, Accession NM_021090) is another VGAM2537 host target gene. MTMR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:22072, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85939] Another function of VGAM2537 is therefore inhibition of

Myotubularin Related Protein 3 (MTMR3, Accession NM_021090), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3. The function of MTMR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1718.Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598) is another VGAM2537 host target gene. NHLH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NHLH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHLH1 BINDING SITE, designated SEQ ID:12125, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85940] Another function of VGAM2537 is therefore inhibition of Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598), a gene which may have a role in development of the nervous system. Accordingly, utilities of

VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHLH1. The function of NHLH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM2537 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6010, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85941] Another function of VGAM2537 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Paired Box Gene 5 (B-cell

lineage specific activator protein) (PAX5, Accession NM_016734) is another VGAM2537 host target gene. PAX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX5 BINDING SITE, designated SEQ ID:18790, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85942] Another function of VGAM2537 is therefore inhibition of Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM_016734), a gene which plays a role in B-cell differentiation, neural development and spermatogenesis. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX5. The function of PAX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 dunce homolog, Drosophila) (PDE4A, Accession NM_006202) is another VGAM2537

host target gene. PDE4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4A BINDING SITE, designated SEQ ID:12874, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85943] Another function of VGAM2537 is therefore inhibition of Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 dunce homolog, Drosophila) (PDE4A, Accession NM_006202), a gene which is a CAMP-specific phosphodiesterase . Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4A. The function of PDE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1214.Peroxisomal Biogenesis Factor 14 (PEX14, Accession XM_033059) is another VGAM2537 host target gene. PEX14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

PEX14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX14 BINDING SITE, designated SEQ ID:31827, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85944] Another function of VGAM2537 is therefore inhibition of Peroxisomal Biogenesis Factor 14 (PEX14, Accession XM_033059), a gene which is a component of the peroxisomal translocation machinery with pex13 and pex17. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX14. The function of PEX14 has been established by previous studies. Working with Saccharomyces cerevisiae, Albertini et al. (1997) described peroxin-14 (PEX14), the first membrane-bound peroxisomal protein that binds to the peroxisomal type-2 targeting signal (PTS2) receptor, PEX7 (OMIM Ref. No. 601757). Thus, the PEX14 protein may represent the functional docking site for PTS2-dependent protein import to the peroxisome. In addition to the interaction with the PTS2 receptor, PEX14 protein was found to interact with PEX5

protein (OMIM Ref. No. 600414), the PTS1 receptor. This observation suggested the overlapping of 2 import pathways, with PEX14 being the point of convergence. Moreover, PEX14 also interacted with 2 other membrane-bound peroxins, including the SH3 domain protein PEX13 (OMIM Ref. No. 601789), the putative docking protein for PTS1-dependent protein import. Albertini et al. (1997) proposed that these 3 peroxins are components of a common translocation machinery. Ligand blot analysis by Fransen et al. (1998) determined that PEX14 binds to both the PTS1 receptor (PEX5) and weakly with the SH3 domain of PEX13. Biochemical analysis indicated that PEX14 is required for the import of PTS1-containing proteins into peroxisomes.

[85945] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85946] Albertini, M.; Rehling, P.; Erdmann, R.; Girzalsky, W.; Kiel, J. A. K. W.; Veenhuis, M.; Kunau, W.-H. : Pex14p, a peroxisomal membrane protein binding both receptors of the two PTS-dependent import pathways. Cell 89: 83-92, 1997. ; and

[85947] Fransen, M.; Terlecky, S. R.; Subramani, S. : Identification

of a human PTS1 receptor docking protein directly required for peroxisomal protein import. Proc. Nat. Acad. Sci. 95: 8087-80.

[85948] Further studies establishing the function and utilities of PEX14 are found in John Hopkins OMIM database record ID 601791, and in sited publications numbered 5791 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013) is another VGAM2537 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:35938, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85949] Another function of VGAM2537 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Phosphoinositide-

3-kinase, Catalytic, Delta Polypeptide (PIK3CD, Accession NM_005026) is another VGAM2537 host target gene. PIK3CD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3CD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3CD BINDING SITE, designated SEQ ID:11463, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85950] Another function of VGAM2537 is therefore inhibition of Phosphoinositide-3-kinase, Catalytic, Delta Polypeptide (PIK3CD, Accession NM_005026), a gene which regulating cell growth. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CD. The function of PIK3CD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2434.Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, Ehlers-Danlos syndrome type VI) (PLOD, Accession NM_000302) is another

VGAM2537 host target gene. PLOD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLOD BINDING SITE, designated SEQ ID:5844, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85951] Another function of VGAM2537 is therefore inhibition of Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, Ehlers-Danlos syndrome type VI) (PLOD, Accession NM_000302). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLOD. Peanut-like 2 (Drosophila) (PNUTL2, Accession NM_080417) is another VGAM2537 host target gene. PNUTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PNUTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNUTL2 BINDING SITE, designated SEQ ID:27837, to the nucleotide

sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85952] Another function of VGAM2537 is therefore inhibition of Peanut-like 2 (Drosophila) (PNUTL2, Accession NM_080417), a gene which is involved in cytokinesis. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL2. The function of PNUTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Polymerase (DNA directed), Eta (POLH, Accession NM_006502) is another VGAM2537 host target gene. POLH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by POLH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE, designated SEQ ID:13250, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85953] Another function of VGAM2537 is therefore inhibition of Polymerase (DNA directed), Eta (POLH, Accession

NM_006502). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH. Prokineticin 1 (PROK1, Accession NM_032414) is another VGAM2537 host target gene. PROK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26200, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85954] Another function of VGAM2537 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000.RAB,

Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM_013412) is another VGAM2537 host target gene. RABL2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABL2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL2A BINDING SITE, designated SEQ ID:15079, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85955] Another function of VGAM2537 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM_013412). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2A. RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM_007081) is another VGAM2537 host target gene. RABL2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABL2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RABL2B BINDING SITE, designated SEQ ID:13946, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85956] Another function of VGAM2537 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM_007081). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2B. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799) is another VGAM2537 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9884, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85957] Another function of VGAM2537 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities

of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.Secretogranin III (SCG3, Accession NM_013243) is another VGAM2537 host target gene. SCG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SCG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCG3 BINDING SITE, designated SEQ ID:14901, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85958] Another function of VGAM2537 is therefore inhibition of Secretogranin III (SCG3, Accession NM_013243). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCG3. Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999) is another VGAM2537 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8890, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85959] Another function of VGAM2537 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999), a gene which is a cell surface proteoglycan. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Selectin P Ligand (SELPLG, Accession XM_006867) is another VGAM2537 host target gene. SELPLG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SELPLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELPLG BINDING SITE, des-

ignated SEQ ID:30017, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85960] Another function of VGAM2537 is therefore inhibition of Selectin P Ligand (SELPLG, Accession XM_006867), a gene which binds to p-, e- and l-selectins, which mediates the tethering and rolling of neutrophils and t-lymphocytes on endothelial cells. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELPLG. The function of SELPLG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719) is another VGAM2537 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11087, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM

RNA, also designated SEQ ID:5248.

[85961] Another function of VGAM2537 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM700.SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025) is another VGAM2537 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8962, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85962] Another function of VGAM2537 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession

NM_003025). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029) is another VGAM2537 host target gene. SHC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHC1 BINDING SITE, designated SEQ ID:8970, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85963] Another function of VGAM2537 is therefore inhibition of SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029), a gene which couples activated growth factor receptors to a signaling pathway. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHC1. The function of SHC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.Sialic Acid

Binding Ig-like Lectin 6 (SIGLEC6, Accession XM_009378) is another VGAM2537 host target gene. SIGLEC6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIGLEC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIGLEC6 BINDING SITE, designated SEQ ID:30108, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85964] Another function of VGAM2537 is therefore inhibition of Sialic Acid Binding Ig-like Lectin 6 (SIGLEC6, Accession XM_009378), a gene which is a cell adhesion molecule for postnatal neural development. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC6. The function of SIGLEC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1566.Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868) is another VGAM2537 host target gene. SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC9A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2, designated SEQ ID:30064 and SEQ ID:10935 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85965] Another function of VGAM2537 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A5. Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM_021021) is another VGAM2537 host target gene. SNTB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SNTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB1 BINDING SITE, designated SEQ

ID:22011, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85966] Another function of VGAM2537 is therefore inhibition of Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM_021021). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB1. SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686) is another VGAM2537 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12242, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85967] Another function of VGAM2537 is therefore inhibition of SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SOX13. TAF4 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 135kDa (TAF4, Accession NM_003185) is another VGAM2537 host target gene. TAF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF4 BINDING SITE, designated SEQ ID:9162, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85968] Another function of VGAM2537 is therefore inhibition of TAF4 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 135kDa (TAF4, Accession NM_003185), a gene which plays a central role in mediating promoter responses to various activators and repressors. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF4. The function of TAF4 has been established by previous studies. Transcription factor TFIID is a multiprotein complex composed of the TATA box-binding protein (TBP; 600075) and multiple TBP-

associated factors (TAFs; OMIM Ref. No. 313650). Tanese et al. (1996) cloned cDNAs encoding 2 subunits of the human TFIID complex: TAFII130 (also symbolized TAF2C1) and TAFII100 (TAF2D; 601787). The longest partial cDNA representing human TAFII130 encodes the predicted C-terminal 947 amino acids of the protein and 1.4 kb of 3-prime untranslated sequence; this cDNA appeared to be missing approximately 100 N-terminal amino acids of TAFII130. Tanese et al. (1996) showed that recombinant TAFII100 and TAFII130 associated with endogenous TAFs and TBP to form a TFIID complex in transfected 293 cells. Their experiments also suggested a role for TAFII130 as a direct coactivator target for Sp1 (OMIM Ref. No. 189906). See also TAF2C2 (OMIM Ref. No. 601689). By biochemical purification and genomic screening, Mengus et al. (1997) obtained a full-length cDNA encoding TAF2C1. Sequence analysis predicted that the 1,083-amino acid protein contains a C-terminal domain and a central region highly homologous to those of TAF2C2. TAF2C1 expression was found to enhance transactivation by the class II nuclear receptors RAR (see OMIM Ref. No. 180240), THRA (see OMIM Ref. No. 190120), and VDR (OMIM Ref. No. 601769) through activation function-2 in the C-terminal ligand-

binding domain.

[85969] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[85970] Mengus, G.; May, M.; Carre, L.; Chambon, P.; Davidson, I. : Human TAF(II)135 potentiates transcriptional activation by the AF-2s of the retinoic acid, vitamin D3, and thyroid hormone receptors in mammalian cells. Genes Dev. 11: 1381-1395, 1997. ; and

[85971] Tanese, N.; Saluja, D.; Vassallo, M. F.; Chen, J.-L.; Admon, A. : Molecular cloning and analysis of two subunits of the human TFIID complex: hTAFII130 and hTAFII100. Proc. Nat. Acad. S.

[85972] Further studies establishing the function and utilities of TAF4 are found in John Hopkins OMIM database record ID 601796, and in sited publications numbered 5225, 6238-623 and 1278 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-ence.TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM2537 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9179, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85973] Another function of VGAM2537 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122.Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545) is another VGAM2537 host target gene. TCF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF1 BINDING SITE, designated SEQ

ID:6146, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85974] Another function of VGAM2537 is therefore inhibition of Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545), a gene which is required for the expression of several liver specific genes. binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF1. The function of TCF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Transcription Factor 7-like 2 (T-cell specific, HMG-box) (TCF7L2, Accession NM_030756) is another VGAM2537 host target gene. TCF7L2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TCF7L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7L2 BINDING SITE, designated SEQ ID:25040, to the nucleotide

sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85975] Another function of VGAM2537 is therefore inhibition of Transcription Factor 7-like 2 (T-cell specific, HMG-box) (TCF7L2, Accession NM_030756), a gene which is a transcriptional activator; interacts with ITF1 (TCF3); and contains basic helix-loop-helix domain. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7L2. The function of TCF7L2 has been established by previous studies. The high mobility group (HMG) box is a DNA-binding domain. TCF7 (OMIM Ref. No. 189908), also called TCF1, and LEF1 (OMIM Ref. No. 153245), also called TCF1-alpha, are human lymphoid transcription factors that contain a virtually identical HMG box. By PCR of human genomic DNA using degenerate oligonucleotides based on the HMG boxes of TCF7 and LEF1, Castrop et al. (1992) identified the TCF7L1 (OMIM Ref. No. 604652) and TCF7L2 genes, which they called TCF3 and TCF4, respectively. TCF7L1 and TCF7L2 were not expressed in cells of the lymphoid lineage. The deduced amino acid sequences of the HMG boxes of TCF7L1, TCF7L2, and TCF7 show striking homology. The authors suggested the existence

of a subfamily of TCF7-like HMG box-containing transcription factors. Animal model experiments lend further support to the function of TCF7L2. To study the physiologic role of Tcf4 (which is encoded by the Tcf7l2 gene), Korinek et al. (1998) disrupted Tcf7l2 by homologous recombination. The homozygous null mice died shortly after birth. A single histopathologic abnormality was observed. An apparently normal transition of intestinal endoderm into epithelium occurred at approximately embryonic day (E) 14.5. However, no proliferative compartments were maintained in the prospective crypt regions between the villi. As a consequence, the neonatal epithelium was composed entirely of differentiated, nondividing villus cells. Korinek et al. (1998) concluded that the genetic program controlled by Tcf7l2 maintains the crypt stem cells of the small intestine. The constitutive activity of Tcf4 in APC-deficient epithelial cells may contribute to their malignant transformation by maintaining stem cell characteristics.

[85976] It is appreciated that the abovementioned animal model for TCF7L2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[85977] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[85978] Castrop, J.; van Norren, K.; Clevers, H. : A gene family of HMG-box transcription factors with homology to TCF-1. Nucleic Acids Res. 20: 611 only, 1992. ; and

[85979] Korinek, V.; Barker, N.; Moerer, P.; van Donselaar, E.; Huls, G.; Peters, P. J.; Clevers, H. : Depletion of epithelial stem-cell compartments in the small intestine of mice lacking Tcf-4.

[85980] Further studies establishing the function and utilities of TCF7L2 are found in John Hopkins OMIM database record ID 602228, and in sited publications numbered 5893-589 and 2303-2305 listed in the bibliography section herein-below, which are also hereby incorporated by refer-ence.TEA Domain Family Member 3 (TEAD3, Accession NM_003214) is another VGAM2537 host target gene. TEAD3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TEAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEAD3 BINDING SITE, designated SEQ ID:9211, to the nucleotide sequence of VGAM2537 RNA,

herein designated VGAM RNA, also designated SEQ ID:5248.

[85981] Another function of VGAM2537 is therefore inhibition of TEA Domain Family Member 3 (TEAD3, Accession NM_003214), a gene which binds to multiple functional elements of the human chorionic somatomammotropin-b gene enhancer. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEAD3. The function of TEAD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299.Telomeric Repeat Binding Factor 2 (TERF2, Accession NM_005652) is another VGAM2537 host target gene. TERF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF2 BINDING SITE, designated SEQ ID:12190, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85982] Another function of VGAM2537 is therefore inhibition of Telomeric Repeat Binding Factor 2 (TERF2, Accession NM_005652), a gene which plays a key role in the protective activity of telomeres. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF2. The function of TERF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1689.TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333) is another VGAM2537 host target gene. TIAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAL1 BINDING SITE, designated SEQ ID:22741, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85983] Another function of VGAM2537 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333), a gene which pos-

sesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAL1. The function of TIAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350.Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326) is another VGAM2537 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9330, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85984] Another function of VGAM2537 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326), a gene which co-

stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074) is another VGAM2537 host target gene. TNFSF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF5 BINDING SITE, designated SEQ ID:5518, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85985] Another function of VGAM2537 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with TNFSF5. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHAE, Accession NM_006761) is another VGAM2537 host target gene. YWHAE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YWHAE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAE BINDING SITE, designated SEQ ID:13613, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85986] Another function of VGAM2537 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHAE, Accession NM_006761), a gene which binds to cdc25 and may facilitate cdc25 interaction with Raf-1 in vivo. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAE. The function of YWHAE and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM656.Zinc Finger Protein 278 (ZNF278, Accession NM_014323) is another VGAM2537 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE4, designated SEQ ID:15625, SEQ ID:25774, SEQ ID:25777 and SEQ ID:25784 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85987] Another function of VGAM2537 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM_014323), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414.AP1 Gamma Subunit Binding Pro-

tein 1 (AP1GBP1, Accession NM_080550) is another VGAM2537 host target gene. AP1GBP1 BINDING SITE1 and AP1GBP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP1GBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE1 and AP1GBP1 BINDING SITE2, designated SEQ ID:27872 and SEQ ID:13362 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85988] Another function of VGAM2537 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080550). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104) is another VGAM2537 host target gene. C14orf4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C14orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C14orf4 BINDING SITE, designated SEQ ID:33444, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85989] Another function of VGAM2537 is therefore inhibition of Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf4. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM2537 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19000, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85990] Another function of VGAM2537 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Ac-

cession NM_017575). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Chromosome 1 Open Reading Frame 25 (C1orf25, Accession XM_051868) is another VGAM2537 host target gene. C1orf25 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C1orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf25 BINDING SITE, designated SEQ ID:35910, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85991] Another function of VGAM2537 is therefore inhibition of Chromosome 1 Open Reading Frame 25 (C1orf25, Accession XM_051868). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf25. CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_033332) is another VGAM2537 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27167, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85992] Another function of VGAM2537 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_033332). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Calsyntenin 3 (CLSTN3, Accession NM_014718) is another VGAM2537 host target gene. CLSTN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLSTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN3 BINDING SITE, designated SEQ ID:16272, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85993] Another function of VGAM2537 is therefore inhibition of

Calsyntenin 3 (CLSTN3, Accession NM_014718). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN3. COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730) is another VGAM2537 host target gene. COPS7B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COPS7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7B BINDING SITE, designated SEQ ID:22933, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85994] Another function of VGAM2537 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7B. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, S. cerevisiae) (DDX12, Accession XM_006936) is another

VGAM2537 host target gene. DDX12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX12 BINDING SITE, designated SEQ ID:30022, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85995] Another function of VGAM2537 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, S. cerevisiae) (DDX12, Accession XM_006936). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX12. DEFCAP (Accession NM_014922) is another VGAM2537 host target gene. DEFCAP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DEFCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEFCAP BINDING SITE, designated SEQ ID:17201, to the nucleotide sequence of VGAM2537 RNA,

herein designated VGAM RNA, also designated SEQ ID:5248.

[85996] Another function of VGAM2537 is therefore inhibition of DEFCAP (Accession NM_014922). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEFCAP. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989) is another VGAM2537 host target gene. DIO2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DIO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE, designated SEQ ID:15167, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85997] Another function of VGAM2537 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. DKFZp434J0617 (Accession NM_032246) is another VGAM2537 host target gene. DKFZp434J0617 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by DKFZp434J0617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J0617 BINDING SITE, designated SEQ ID:25982, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85998] Another function of VGAM2537 is therefore inhibition of DKFZp434J0617 (Accession NM_032246). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J0617. DKFZP434N014 (Accession XM_027012) is another VGAM2537 host target gene. DKFZP434N014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434N014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N014 BINDING SITE, designated SEQ ID:30389, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[85999] Another function of VGAM2537 is therefore inhibition of DKFZP434N014 (Accession XM_027012). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N014. DKFZp434P0531 (Accession XM_166410) is another VGAM2537 host target gene. DKFZp434P0531 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434P0531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434P0531 BINDING SITE, designated SEQ ID:44281, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86000] Another function of VGAM2537 is therefore inhibition of DKFZp434P0531 (Accession XM_166410). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434P0531. DKFZP586N0721 (Accession NM_015400) is another VGAM2537 host target gene. DKFZP586N0721 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:17708, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86001] Another function of VGAM2537 is therefore inhibition of DKFZP586N0721 (Accession NM_015400). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. DKFZp761G2113 (Accession XM_046017) is another VGAM2537 host target gene. DKFZp761G2113 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:34641, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86002] Another function of VGAM2537 is therefore inhibition of

DKFZp761G2113 (Accession XM_046017). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113. EZF-2 (Accession NM_018337) is another VGAM2537 host target gene. EZF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EZF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZF-2 BINDING SITE, designated SEQ ID:20340, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86003] Another function of VGAM2537 is therefore inhibition of EZF-2 (Accession NM_018337). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZF-2. F-box Only Protein 27 (FBXO27, Accession XM_059045) is another VGAM2537 host target gene. FBXO27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36834, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86004] Another function of VGAM2537 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM_059045). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27. FHX (Accession NM_018416) is another VGAM2537 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20457, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86005] Another function of VGAM2537 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ10074 (Accession NM_017988) is another VGAM2537

host target gene. FLJ10074 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10074 BINDING SITE, designated SEQ ID:19720, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86006] Another function of VGAM2537 is therefore inhibition of FLJ10074 (Accession NM_017988). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10074. FLJ10704 (Accession NM_018185) is another VGAM2537 host target gene. FLJ10704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:20032, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86007] Another function of VGAM2537 is therefore inhibition of FLJ10704 (Accession NM_018185). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ11286 (Accession NM_018381) is another VGAM2537 host target gene. FLJ11286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11286 BINDING SITE, designated SEQ ID:20415, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86008] Another function of VGAM2537 is therefore inhibition of FLJ11286 (Accession NM_018381). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11286. FLJ11939 (Accession NM_024679) is another VGAM2537 host target gene. FLJ11939 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11939 BINDING SITE, designated SEQ ID:23991, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86009] Another function of VGAM2537 is therefore inhibition of FLJ11939 (Accession NM_024679). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11939. FLJ12541 (Accession NM_022369) is another VGAM2537 host target gene. FLJ12541 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12541 BINDING SITE, designated SEQ ID:22757, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86010] Another function of VGAM2537 is therefore inhibition of FLJ12541 (Accession NM_022369). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12541. FLJ12816 (Accession NM_022060) is another VGAM2537 host target gene. FLJ12816 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12816 BINDING SITE, designated SEQ ID:22603, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86011] Another function of VGAM2537 is therefore inhibition of FLJ12816 (Accession NM_022060). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12816. FLJ12921 (Accession NM_024875) is another VGAM2537 host target gene. FLJ12921 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12921 BINDING SITE, designated SEQ ID:24309, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM

RNA, also designated SEQ ID:5248.

[86012] Another function of VGAM2537 is therefore inhibition of FLJ12921 (Accession NM_024875). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12921. FLJ14721 (Accession NM_032829) is another VGAM2537 host target gene. FLJ14721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14721 BINDING SITE, designated SEQ ID:26604, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86013] Another function of VGAM2537 is therefore inhibition of FLJ14721 (Accession NM_032829). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14721. FLJ14950 (Accession NM_032865) is another VGAM2537 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26671, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86014] Another function of VGAM2537 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ22596 (Accession NM_025086) is another VGAM2537 host target gene. FLJ22596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22596 BINDING SITE, designated SEQ ID:24703, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86015] Another function of VGAM2537 is therefore inhibition of FLJ22596 (Accession NM_025086). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22596. FLJ23537 (Accession NM_024889) is another VGAM2537 host target gene. FLJ23537 BINDING SITE1 through FLJ23537 BINDING SITE16 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ23537, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23537 BINDING SITE1 through FLJ23537 BINDING SITE16, designated SEQ ID:24362, SEQ ID:24359, SEQ ID:24360, SEQ ID:24361, SEQ ID:24347, SEQ ID:24348, SEQ ID:24349, SEQ ID:24350, SEQ ID:24351, SEQ ID:24352, SEQ ID:24353, SEQ ID:24354, SEQ ID:24355, SEQ ID:24356, SEQ ID:24357 and SEQ ID:24358 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86016] Another function of VGAM2537 is therefore inhibition of FLJ23537 (Accession NM_024889). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23537. FLJ32658 (Accession NM_144688) is another VGAM2537 host target gene. FLJ32658 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32658, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32658 BINDING SITE, designated SEQ ID:29508, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86017] Another function of VGAM2537 is therefore inhibition of FLJ32658 (Accession NM_144688). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32658. Guanine Nucleotide Binding Protein (G protein), Gamma 3 (GNG3, Accession NM_012202) is another VGAM2537 host target gene. GNG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG3 BINDING SITE, designated SEQ ID:14508, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86018] Another function of VGAM2537 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 3 (GNG3, Accession NM_012202). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG3. Glycoprotein A33 (transmembrane) (GPA33, Accession NM_005814) is another VGAM2537 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:12403, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86019] Another function of VGAM2537 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM_005814). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. GR6 (Accession NM_007354) is another VGAM2537 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14281, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86020] Another function of VGAM2537 is therefore inhibition of GR6 (Accession NM_007354). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. GTPBG3 (Accession NM_032620) is another VGAM2537 host target gene. GTPBG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE, designated SEQ ID:26333, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86021] Another function of VGAM2537 is therefore inhibition of GTPBG3 (Accession NM_032620). Accordingly, utilities of

VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM2537 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32526, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86022] Another function of VGAM2537 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HMT1 HnRNP Methyltransferase-like 3 (S. cerevisiae) (HRMT1L3, Accession NM_019854) is another VGAM2537 host target gene. HRMT1L3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRMT1L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HRMT1L3 BINDING SITE, designated SEQ ID:21258, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86023] Another function of VGAM2537 is therefore inhibition of HMT1 HnRNP Methyltransferase-like 3 (S. cerevisiae) (HRMT1L3, Accession NM_019854). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRMT1L3. HTMP10 (Accession NM_033207) is another VGAM2537 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:27048, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86024] Another function of VGAM2537 is therefore inhibition of HTMP10 (Accession NM_033207). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HTMP10. IMP-2 (Accession NM_006548) is another VGAM2537 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:13304, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86025] Another function of VGAM2537 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KALI (Accession NM_052931) is another VGAM2537 host target gene. KALI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KALI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KALI BINDING SITE, designated SEQ ID:27488, to the nucleotide sequence of VGAM2537 RNA,

herein designated VGAM RNA, also designated SEQ ID:5248.

[86026] Another function of VGAM2537 is therefore inhibition of KALI (Accession NM_052931). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KALI. KIAA0121 (Accession XM_052386) is another VGAM2537 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35968, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86027] Another function of VGAM2537 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0205 (Accession NM_014873) is another VGAM2537 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17006, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86028] Another function of VGAM2537 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA0227 (Accession XM_027236) is another VGAM2537 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30452, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86029] Another function of VGAM2537 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities

of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA0350 (Accession XM_028332) is another VGAM2537 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30666, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86030] Another function of VGAM2537 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0451 (Accession NM_014826) is another VGAM2537 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0451 BINDING SITE, designated SEQ ID:16804, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86031] Another function of VGAM2537 is therefore inhibition of KIAA0451 (Accession NM_014826). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. KIAA0461 (Accession XM_047883) is another VGAM2537 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35074, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86032] Another function of VGAM2537 is therefore inhibition of KIAA0461 (Accession XM_047883). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. KIAA0731 (Accession XM_039975) is another VGAM2537 host target gene. KIAA0731 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:33240, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86033] Another function of VGAM2537 is therefore inhibition of KIAA0731 (Accession XM_039975). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. KIAA0872 (Accession NM_014940) is another VGAM2537 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17244, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86034] Another function of VGAM2537 is therefore inhibition of

KIAA0872 (Accession NM_014940). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. KIAA1030 (Accession XM_167789) is another VGAM2537 host target gene. KIAA1030 BINDING SITE1 and KIAA1030 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1030, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE1 and KIAA1030 BINDING SITE2, designated SEQ ID:44820 and SEQ ID:44821 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86035] Another function of VGAM2537 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. KIAA1205 (Accession XM_046305) is another VGAM2537 host target gene. KIAA1205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1205, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1205 BINDING SITE, designated SEQ ID:34706, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86036] Another function of VGAM2537 is therefore inhibition of KIAA1205 (Accession XM_046305). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1205. KIAA1465 (Accession XM_027396) is another VGAM2537 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30501, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86037] Another function of VGAM2537 is therefore inhibition of KIAA1465 (Accession XM_027396). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1465. KIAA1538 (Accession XM_049474) is another VGAM2537 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35423, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86038] Another function of VGAM2537 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1750 (Accession XM_043067) is another VGAM2537 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33875, to the

nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86039] Another function of VGAM2537 is therefore inhibition of KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1817 (Accession XM_042978) is another VGAM2537 host target gene. KIAA1817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1817 BINDING SITE, designated SEQ ID:33862, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86040] Another function of VGAM2537 is therefore inhibition of KIAA1817 (Accession XM_042978). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1817. KIAA1819 (Accession XM_045716) is another VGAM2537 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA1819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34533, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86041] Another function of VGAM2537 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. KIAA1853 (Accession XM_045184) is another VGAM2537 host target gene. KIAA1853 BINDING SITE1 and KIAA1853 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1853, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE1 and KIAA1853 BINDING SITE2, designated SEQ ID:34387 and SEQ ID:34386 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86042] Another function of VGAM2537 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. KIAA1855 (Accession XM_166453) is another VGAM2537 host target gene. KIAA1855 BINDING SITE1 and KIAA1855 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1855, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE1 and KIAA1855 BINDING SITE2, designated SEQ ID:44355 and SEQ ID:25863 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86043] Another function of VGAM2537 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. KIAA1938 (Accession XM_166407) is another VGAM2537 host target gene. KIAA1938 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1938 BINDING SITE, designated SEQ ID:44276, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86044] Another function of VGAM2537 is therefore inhibition of KIAA1938 (Accession XM_166407). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1938. Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439) is another VGAM2537 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13150, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86045] Another function of VGAM2537 is therefore inhibition of

Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. METL (Accession NM_018396) is another VGAM2537 host target gene. METL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by METL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of METL BINDING SITE, designated SEQ ID:20433, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86046] Another function of VGAM2537 is therefore inhibition of METL (Accession NM_018396). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with METL. MGC2714 (Accession NM_032299) is another VGAM2537 host target gene. MGC2714 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MGC2714 BINDING SITE, designated SEQ ID:26079, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86047] Another function of VGAM2537 is therefore inhibition of MGC2714 (Accession NM_032299). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2714. MGC4737 (Accession NM_031466) is another VGAM2537 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:25506, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86048] Another function of VGAM2537 is therefore inhibition of MGC4737 (Accession NM_031466). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. MGC4796 (Accession XM_029031) is another

VGAM2537 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30830, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86049] Another function of VGAM2537 is therefore inhibition of MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. moblak (Accession NM_130807) is another VGAM2537 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28307, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86050] Another function of VGAM2537 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. N4BP3 (Accession XM_038920) is another VGAM2537 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32935, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86051] Another function of VGAM2537 is therefore inhibition of N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. NDST4 (Accession NM_022569) is another VGAM2537 host target gene. NDST4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NDST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDST4 BINDING SITE, designated SEQ ID:22891, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86052] Another function of VGAM2537 is therefore inhibition of NDST4 (Accession NM_022569). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDST4. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM2537 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32718, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86053] Another function of VGAM2537 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NXPH3. P450RAI-2 (Accession NM_019885) is another VGAM2537 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21268, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86054] Another function of VGAM2537 is therefore inhibition of P450RAI-2 (Accession NM_019885). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714) is another VGAM2537 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8575, to the nucleotide sequence of

VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86055] Another function of VGAM2537 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. PRKRI (Accession NM_006260) is another VGAM2537 host target gene. PRKRI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRKRI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKRI BINDING SITE, designated SEQ ID:12944, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86056] Another function of VGAM2537 is therefore inhibition of PRKRI (Accession NM_006260). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKRI. Polymerase I and Transcript Release Factor (PTRF, Accession XM_032852) is another VGAM2537 host target gene.

PTRF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTRF BINDING SITE, designated SEQ ID:31782, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86057] Another function of VGAM2537 is therefore inhibition of Polymerase I and Transcript Release Factor (PTRF, Accession XM_032852). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTRF. RAB35, Member RAS Oncogene Family (RAB35, Accession NM_006861) is another VGAM2537 host target gene. RAB35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB35 BINDING SITE, designated SEQ ID:13732, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86058] Another function of VGAM2537 is therefore inhibition of RAB35, Member RAS Oncogene Family (RAB35, Accession NM_006861). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB35. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401) is another VGAM2537 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15062, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86059] Another function of VGAM2537 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. RAI (Accession NM_006663) is another VGAM2537 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13470, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86060] Another function of VGAM2537 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. REV1-like (yeast) (REV1L, Accession NM_016316) is another VGAM2537 host target gene. REV1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by REV1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REV1L BINDING SITE, designated SEQ ID:18435, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86061] Another function of VGAM2537 is therefore inhibition of REV1-like (yeast) (REV1L, Accession NM_016316). Accordingly, utilities of VGAM2537 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with REV1L. Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6B (SEMA6B, Accession NM_032108) is another VGAM2537 host target gene. SEMA6B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEMA6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA6B BINDING SITE, designated SEQ ID:25799, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86062] Another function of VGAM2537 is therefore inhibition of Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6B (SEMA6B, Accession NM_032108). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA6B. Smith-Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774) is another VGAM2537 host target gene. SMCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SMCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:29562, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86063] Another function of VGAM2537 is therefore inhibition of Smith-Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. SP192 (Accession NM_021639) is another VGAM2537 host target gene. SP192 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP192 BINDING SITE, designated SEQ ID:22296, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86064] Another function of VGAM2537 is therefore inhibition of

SP192 (Accession NM_021639). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP192. SSH2 (Accession XM_030846) is another VGAM2537 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31180, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86065] Another function of VGAM2537 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM_014574) is another VGAM2537 host target gene. STRN3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of STRN3 BINDING SITE, designated SEQ ID:15935, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86066] Another function of VGAM2537 is therefore inhibition of Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM_014574). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRN3. Syntaxin 1B2 (STX1B2, Accession NM_052874) is another VGAM2537 host target gene. STX1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STX1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX1B2 BINDING SITE, designated SEQ ID:27454, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86067] Another function of VGAM2537 is therefore inhibition of Syntaxin 1B2 (STX1B2, Accession NM_052874). Accordingly, utilities of VGAM2537 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with STX1B2. TRIP-Br2 (Accession NM_014755) is another VGAM2537 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16486, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86068] Another function of VGAM2537 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. TUSP (Accession NM_020245) is another VGAM2537 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21524, to the nucleotide sequence of VGAM2537

RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86069] Another function of VGAM2537 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Zinc Finger, DHHC Domain Containing 8 (ZDHHC8, Accession XM_033828) is another VGAM2537 host target gene. ZDHHC8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC8 BINDING SITE, designated SEQ ID:31961, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86070] Another function of VGAM2537 is therefore inhibition of Zinc Finger, DHHC Domain Containing 8 (ZDHHC8, Accession XM_033828). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC8. ZIN (Accession NM_013403) is another VGAM2537 host target

gene. ZIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIN BINDING SITE, designated SEQ ID:15071, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86071] Another function of VGAM2537 is therefore inhibition of ZIN (Accession NM_013403). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIN. LOC116411 (Accession XM_058095) is another VGAM2537 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36565, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86072] Another function of VGAM2537 is therefore inhibition of

LOC116411 (Accession XM_058095). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC120376 (Accession XM_071712) is another VGAM2537 host target gene. LOC120376 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120376 BINDING SITE, designated SEQ ID:37413, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86073] Another function of VGAM2537 is therefore inhibition of LOC120376 (Accession XM_071712). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120376. LOC123096 (Accession XM_058679) is another VGAM2537 host target gene. LOC123096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC123096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC123096 BINDING SITE, designated SEQ ID:36720, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86074] Another function of VGAM2537 is therefore inhibition of LOC123096 (Accession XM_058679). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123096. LOC124446 (Accession XM_058805) is another VGAM2537 host target gene. LOC124446 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124446 BINDING SITE, designated SEQ ID:36750, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86075] Another function of VGAM2537 is therefore inhibition of LOC124446 (Accession XM_058805). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124446. LOC133308 (Accession XM_059638) is an-

other VGAM2537 host target gene. LOC133308 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133308 BINDING SITE, designated SEQ ID:37034, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86076] Another function of VGAM2537 is therefore inhibition of LOC133308 (Accession XM_059638). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133308. LOC142972 (Accession XM_036593) is another VGAM2537 host target gene. LOC142972 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142972 BINDING SITE, designated SEQ ID:32477, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86077] Another function of VGAM2537 is therefore inhibition of LOC142972 (Accession XM_036593). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142972. LOC143524 (Accession XM_084559) is another VGAM2537 host target gene. LOC143524 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143524 BINDING SITE, designated SEQ ID:37628, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86078] Another function of VGAM2537 is therefore inhibition of LOC143524 (Accession XM_084559). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143524. LOC143920 (Accession XM_084658) is another VGAM2537 host target gene. LOC143920 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143920, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143920 BINDING SITE, designated SEQ ID:37639, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86079] Another function of VGAM2537 is therefore inhibition of LOC143920 (Accession XM_084658). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143920. LOC144373 (Accession XM_084841) is another VGAM2537 host target gene. LOC144373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144373 BINDING SITE, designated SEQ ID:37727, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86080] Another function of VGAM2537 is therefore inhibition of LOC144373 (Accession XM_084841). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144373. LOC144501 (Accession XM_096612) is another VGAM2537 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40424, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86081] Another function of VGAM2537 is therefore inhibition of LOC144501 (Accession XM_096612). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC144559 (Accession XM_084896) is another VGAM2537 host target gene. LOC144559 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144559 BINDING SITE, designated SEQ ID:37764, to the nucleotide sequence of VGAM2537 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5248.

[86082] Another function of VGAM2537 is therefore inhibition of LOC144559 (Accession XM_084896). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144559. LOC145255 (Accession XM_096748) is another VGAM2537 host target gene. LOC145255 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145255 BINDING SITE, designated SEQ ID:40528, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86083] Another function of VGAM2537 is therefore inhibition of LOC145255 (Accession XM_096748). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145255. LOC145719 (Accession XM_096848) is another VGAM2537 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145719, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40575, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86084] Another function of VGAM2537 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC147057 (Accession XM_097166) is another VGAM2537 host target gene. LOC147057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147057 BINDING SITE, designated SEQ ID:40783, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86085] Another function of VGAM2537 is therefore inhibition of LOC147057 (Accession XM_097166). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147057. LOC149478 (Accession XM_086536) is another VGAM2537 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38750, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86086] Another function of VGAM2537 is therefore inhibition of LOC149478 (Accession XM_086536). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC150135 (Accession XM_086785) is another VGAM2537 host target gene. LOC150135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150135 BINDING SITE, designated SEQ ID:38845, to

the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86087] Another function of VGAM2537 is therefore inhibition of LOC150135 (Accession XM_086785). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150135. LOC150498 (Accession XM_086931) is another VGAM2537 host target gene. LOC150498 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150498, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150498 BINDING SITE, designated SEQ ID:38984, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86088] Another function of VGAM2537 is therefore inhibition of LOC150498 (Accession XM_086931). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150498. LOC152220 (Accession XM_098176) is another VGAM2537 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41441, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86089] Another function of VGAM2537 is therefore inhibition of LOC152220 (Accession XM_098176). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC155006 (Accession XM_088117) is another VGAM2537 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39524, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86090] Another function of VGAM2537 is therefore inhibition of LOC155006 (Accession XM_088117). Accordingly, utilities

of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC157848 (Accession XM_088405) is another VGAM2537 host target gene. LOC157848 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157848 BINDING SITE, designated SEQ ID:39673, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86091] Another function of VGAM2537 is therefore inhibition of LOC157848 (Accession XM_088405). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157848. LOC167147 (Accession XM_094310) is another VGAM2537 host target gene. LOC167147 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC167147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC167147 BINDING SITE, designated SEQ ID:40226, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86092] Another function of VGAM2537 is therefore inhibition of LOC167147 (Accession XM_094310). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167147. LOC199786 (Accession XM_114021) is another VGAM2537 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42619, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86093] Another function of VGAM2537 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC201500 (Accession XM_117101) is another VGAM2537 host target gene. LOC201500 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201500 BINDING SITE, designated SEQ ID:43223, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86094] Another function of VGAM2537 is therefore inhibition of LOC201500 (Accession XM_117101). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201500. LOC202460 (Accession XM_114493) is another VGAM2537 host target gene. LOC202460 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:42982, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86095] Another function of VGAM2537 is therefore inhibition of

LOC202460 (Accession XM_114493). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202460. LOC203248 (Accession XM_114659) is another VGAM2537 host target gene. LOC203248 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203248 BINDING SITE, designated SEQ ID:43018, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86096] Another function of VGAM2537 is therefore inhibition of LOC203248 (Accession XM_114659). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203248. LOC203504 (Accession XM_117550) is another VGAM2537 host target gene. LOC203504 BINDING SITE1 and LOC203504 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC203504, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE1 and LOC203504 BINDING SITE2, designated SEQ ID:43568 and SEQ ID:43569 respectively, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86097] Another function of VGAM2537 is therefore inhibition of LOC203504 (Accession XM_117550). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. LOC221833 (Accession XM_166519) is another VGAM2537 host target gene. LOC221833 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221833 BINDING SITE, designated SEQ ID:44455, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86098] Another function of VGAM2537 is therefore inhibition of LOC221833 (Accession XM_166519). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221833. LOC221922 (Accession XM_166555) is another VGAM2537 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44532, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86099] Another function of VGAM2537 is therefore inhibition of LOC221922 (Accession XM_166555). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. LOC221935 (Accession XM_166537) is another VGAM2537 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44500, to

the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86100] Another function of VGAM2537 is therefore inhibition of LOC221935 (Accession XM_166537). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC222070 (Accession XM_168433) is another VGAM2537 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45179, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86101] Another function of VGAM2537 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC253143 (Accession XM_173062) is another VGAM2537 host target gene. LOC253143 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC253143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253143 BINDING SITE, designated SEQ ID:46315, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86102] Another function of VGAM2537 is therefore inhibition of LOC253143 (Accession XM_173062). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253143. LOC254387 (Accession XM_170731) is another VGAM2537 host target gene. LOC254387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254387 BINDING SITE, designated SEQ ID:45488, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86103] Another function of VGAM2537 is therefore inhibition of LOC254387 (Accession XM_170731). Accordingly, utilities

of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254387. LOC255515 (Accession XM_171185) is another VGAM2537 host target gene. LOC255515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255515 BINDING SITE, designated SEQ ID:45960, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86104] Another function of VGAM2537 is therefore inhibition of LOC255515 (Accession XM_171185). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255515. LOC257463 (Accession XM_048605) is another VGAM2537 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257463 BINDING SITE, designated SEQ ID:35209, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86105] Another function of VGAM2537 is therefore inhibition of LOC257463 (Accession XM_048605). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. LOC56961 (Accession XM_031857) is another VGAM2537 host target gene. LOC56961 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56961 BINDING SITE, designated SEQ ID:31506, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86106] Another function of VGAM2537 is therefore inhibition of LOC56961 (Accession XM_031857). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56961. LOC57105 (Accession NM_020377) is another VGAM2537 host target gene. LOC57105 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57105 BINDING SITE, designated SEQ ID:21638, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86107] Another function of VGAM2537 is therefore inhibition of LOC57105 (Accession NM_020377). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57105. LOC90643 (Accession XM_033145) is another VGAM2537 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31853, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86108] Another function of VGAM2537 is therefore inhibition of

LOC90643 (Accession XM_033145). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. LOC90906 (Accession XM_034809) is another VGAM2537 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32149, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86109] Another function of VGAM2537 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. LOC91308 (Accession XM_037600) is another VGAM2537 host target gene. LOC91308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91308 BINDING SITE, designated SEQ ID:32656, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86110] Another function of VGAM2537 is therefore inhibition of LOC91308 (Accession XM_037600). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91308. LOC91397 (Accession XM_038219) is another VGAM2537 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32781, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86111] Another function of VGAM2537 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. LOC91974 (Accession XM_041974) is another

VGAM2537 host target gene. LOC91974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91974 BINDING SITE, designated SEQ ID:33652, to the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, also designated SEQ ID:5248.

[86112] Another function of VGAM2537 is therefore inhibition of LOC91974 (Accession XM_041974). Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2538 (VGAM2538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86113] VGAM2538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2538 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[86114] VGAM2538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Reindeer-1. VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86115] VGAM2538 gene encodes a VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2538 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2538 precursor RNA is designated SEQ ID:2524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2524 is located at position 2796 relative to the genome of Pestivirus Reindeer-1.

[86116] VGAM2538 precursor RNA folds onto itself, forming VGAM2538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86117] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2538 folded precursor RNA into VGAM2538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2538 RNA is designated SEQ ID:5249, and is provided hereinbelow with reference to the sequence listing part.

[86118] VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2538 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86119] VGAM2538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2538 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86120] The complementary binding of VGAM2538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2538 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2538 host target RNA into VGAM2538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86121] It is appreciated that VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2538 host target genes. The mRNA of each one of this plurality of VGAM2538 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2538 RNA, herein designated VGAM RNA, and which when bound by VGAM2538 RNA causes inhibition of translation of respective one or more VGAM2538 host target proteins.

[86122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2538 gene, herein designated VGAM GENE, on one or more VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86123] It is yet further appreciated that a function of VGAM2538 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of viral infection by Pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2538 correlate with, and may be deduced from, the identity of the host target genes which VGAM2538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86124] Nucleotide sequences of the VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2538 are further described hereinbelow with reference to Table 1.

[86125] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2538 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86126] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2538 gene, herein designated VGAM is inhibition of expression of VGAM2538 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2538 correlate with, and may be deduced from, the identity of the target genes which VGAM2538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86127] Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286) is a VGAM2538 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27615, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86128] A function of VGAM2538 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131) is another VGAM2538 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:5611 and SEQ ID:21240 respectively, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86129] Another function of VGAM2538 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. Translin (TSN, Accession NM_004622) is another VGAM2538 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10983, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86130] Another function of VGAM2538 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM2538

include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.ARGBP2 (Accession NM_003603) is another VGAM2538 host target gene. ARGBP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARGBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARGBP2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86131] Another function of VGAM2538 is therefore inhibition of ARGBP2 (Accession NM_003603). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARGBP2. FLJ11800 (Accession NM_024974) is another VGAM2538 host target gene. FLJ11800 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11800, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:24530, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86132] Another function of VGAM2538 is therefore inhibition of FLJ11800 (Accession NM_024974). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11800. FLJ12649 (Accession NM_024597) is another VGAM2538 host target gene. FLJ12649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12649 BINDING SITE, designated SEQ ID:23833, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86133] Another function of VGAM2538 is therefore inhibition of FLJ12649 (Accession NM_024597). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12649. GREB1 (Accession XM_051545) is another VGAM2538 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:35851, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86134] Another function of VGAM2538 is therefore inhibition of GREB1 (Accession XM_051545). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. MGC3329 (Accession NM_024086) is another VGAM2538 host target gene. MGC3329 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3329 BINDING SITE, designated SEQ ID:23528, to the nucleotide sequence of

VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86135] Another function of VGAM2538 is therefore inhibition of MGC3329 (Accession NM_024086). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3329. S164 (Accession XM_027330) is another VGAM2538 host target gene. S164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by S164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S164 BINDING SITE, designated SEQ ID:30482, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86136] Another function of VGAM2538 is therefore inhibition of S164 (Accession XM_027330). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S164. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM2538 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30040, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86137] Another function of VGAM2538 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC220575 (Accession XM_083991) is another VGAM2538 host target gene. LOC220575 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220575, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220575 BINDING SITE, designated SEQ ID:37528, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86138] Another function of VGAM2538 is therefore inhibition of LOC220575 (Accession XM_083991). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220575. LOC90593 (Accession XM_032815) is another VGAM2538 host target gene. LOC90593 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90593 BINDING SITE, designated SEQ ID:31765, to the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, also designated SEQ ID:5249.

[86139] Another function of VGAM2538 is therefore inhibition of LOC90593 (Accession XM_032815). Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90593. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2539 (VGAM2539) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[86140] VGAM2539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2539 was detected is described hereinabove with reference to Figs. 1-8.

[86141] VGAM2539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Giraffe-1. VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86142] VGAM2539 gene encodes a VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2539 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2539 precursor RNA is designated SEQ ID:2525, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2525 is located at position 1159 relative to the genome of Pestivirus Giraffe-1.

[86143] VGAM2539 precursor RNA folds onto itself, forming VGAM2539 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2539 folded precursor RNA into VGAM2539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2539 RNA is designated SEQ ID:5250, and is provided hereinbelow with reference to the sequence listing part.

[86145] VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2539 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86146] VGAM2539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2539 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86147] The complementary binding of VGAM2539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2539 host target RNA into VGAM2539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86148] It is appreciated that VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2539 host target genes. The mRNA of each one of this plurality of VGAM2539 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2539 RNA, herein designated VGAM RNA, and which when bound by VGAM2539 RNA causes inhibition of translation of respective one or more VGAM2539 host target proteins.

[86149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2539 gene, herein designated VGAM GENE, on one or more VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86150] It is yet further appreciated that a function of VGAM2539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of viral infection by Pestivirus Giraffe-1. Specific functions, and accordingly utilities, of VGAM2539 correlate with, and may be deduced from, the identity of the host target genes which VGAM2539 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[86151] Nucleotide sequences of the VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2539 are further described hereinbelow with reference to Table 1.

[86152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2539 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2539 gene, herein designated VGAM is inhibition of expression of VGAM2539 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2539 correlate with, and may be deduced from, the identity of the target genes which VGAM2539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86154] Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111) is a VGAM2539 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6775, SEQ ID:17961 and SEQ ID:17968 respectively, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86155] A function of VGAM2539 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.CXYorf1 (Accession XM_088704) is another VGAM2539 host target gene. CXYorf1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39907, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86156] Another function of VGAM2539 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. Eukaryotic Translation Initiation Factor 4 Gamma, 3 (EIF4G3, Accession NM_003760) is another VGAM2539 host target gene. EIF4G3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EIF4G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G3 BINDING SITE, designated SEQ ID:9841, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86157] Another function of VGAM2539 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 3 (EIF4G3, Accession NM_003760). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G3. FLJ20584 (Accession NM_017891) is another VGAM2539 host target gene. FLJ20584 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19560, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86158] Another function of VGAM2539 is therefore inhibition of FLJ20584 (Accession NM_017891). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. FLJ22390 (Accession NM_022746) is another VGAM2539 host target gene. FLJ22390 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22390, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:22957, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86159] Another function of VGAM2539 is therefore inhibition of FLJ22390 (Accession NM_022746). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. KIAA1453 (Accession NM_025090) is another VGAM2539 host target gene. KIAA1453 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1453 BINDING SITE, designated SEQ ID:24714, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86160] Another function of VGAM2539 is therefore inhibition of KIAA1453 (Accession NM_025090). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1453. MGC14859 (Accession XM_030295) is another VGAM2539 host target gene. MGC14859 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14859 BINDING SITE, designated SEQ ID:31005, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86161] Another function of VGAM2539 is therefore inhibition of MGC14859 (Accession XM_030295). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14859. PRO1048 (Accession NM_018497) is another VGAM2539 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20559, to the nucleotide

sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86162] Another function of VGAM2539 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. RPH3A (Accession NM_014954) is another VGAM2539 host target gene. RPH3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3A BINDING SITE, designated SEQ ID:17306, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86163] Another function of VGAM2539 is therefore inhibition of RPH3A (Accession NM_014954). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3A. Syntaphilin (SNPH, Accession NM_014723) is another VGAM2539 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16293, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86164] Another function of VGAM2539 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. SPEC1 (Accession NM_020239) is another VGAM2539 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21511, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86165] Another function of VGAM2539 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of

VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. Zinc Finger Protein 300 (ZNF300, Accession NM_052860) is another VGAM2539 host target gene. ZNF300 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF300 BINDING SITE, designated SEQ ID:27440, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86166] Another function of VGAM2539 is therefore inhibition of Zinc Finger Protein 300 (ZNF300, Accession NM_052860). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF300. LOC146756 (Accession XM_097085) is another VGAM2539 host target gene. LOC146756 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC146756 BINDING SITE, designated SEQ ID:40737, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86167] Another function of VGAM2539 is therefore inhibition of LOC146756 (Accession XM_097085). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC92661 (Accession XM_046465) is another VGAM2539 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34722, to the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, also designated SEQ ID:5250.

[86168] Another function of VGAM2539 is therefore inhibition of LOC92661 (Accession XM_046465). Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2540 (VGAM2540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86169] VGAM2540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2540 was detected is described hereinabove with reference to Figs. 1-8.

[86170] VGAM2540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Giraffe-1. VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86171] VGAM2540 gene encodes a VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2540 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2540 precursor RNA is designated SEQ ID:2526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2526 is located at position 4480 relative to the genome of Pestivirus Giraffe-1.

[86172] VGAM2540 precursor RNA folds onto itself, forming VGAM2540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86173] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2540 folded precursor RNA into VGAM2540 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2540 RNA is designated SEQ ID:5251, and is provided hereinbelow with reference to the sequence listing part.

[86174] VGAM2540 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2540 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86175] VGAM2540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2540 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2540 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86176] The complementary binding of VGAM2540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2540 host target RNA into VGAM2540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86177] It is appreciated that VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2540 host target genes. The mRNA of each one of this plurality of VGAM2540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2540 RNA, herein designated VGAM RNA, and which when bound by VGAM2540 RNA causes inhibition of translation of respective one or more

VGAM2540 host target proteins.

[86178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2540 gene, herein designated VGAM GENE, on one or more VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86179] It is yet further appreciated that a function of VGAM2540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2540 include diagnosis, prevention and treatment of viral infection by Pestivirus Giraffe-1. Specific

functions, and accordingly utilities, of VGAM2540 correlate with, and may be deduced from, the identity of the host target genes which VGAM2540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86180] Nucleotide sequences of the VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2540 are further described hereinbelow with reference to Table 1.

[86181] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2540 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2540 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86182] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2540 gene, herein designated VGAM is inhibition of expression of VGAM2540 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2540 correlate with, and may be deduced from, the identity of the target genes which VGAM2540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86183] FLJ13659 (Accession NM_025189) is a VGAM2540 host target gene. FLJ13659 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13659 BINDING SITE, designated SEQ ID:24833, to the nucleotide sequence of VGAM2540 RNA, herein designated VGAM RNA, also designated SEQ ID:5251.

[86184] A function of VGAM2540 is therefore inhibition of FLJ13659 (Accession NM_025189). Accordingly, utilities of VGAM2540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13659. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2541 (VGAM2541) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[86185] VGAM2541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2541 was detected is described hereinabove with reference to Figs. 1-8.

[86186] VGAM2541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86187] VGAM2541 gene encodes a VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2541 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2541 precursor RNA is designated SEQ ID:2527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2527 is located at position 1698 relative to the genome of Langat Virus.

[86188] VGAM2541 precursor RNA folds onto itself, forming VGAM2541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86189] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2541 folded precursor RNA into VGAM2541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2541 RNA is designated SEQ ID:5252, and is provided hereinbelow with reference to the sequence listing part.

[86190] VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2541 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86191] VGAM2541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2541 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[86192] The complementary binding of VGAM2541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2541 host target RNA into VGAM2541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86193] It is appreciated that VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2541 host target genes. The mRNA of each one of this plurality of VGAM2541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2541 RNA, herein designated VGAM RNA, and which when bound by VGAM2541 RNA causes inhibition of translation of respective one or more VGAM2541 host target proteins.

[86194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2541 gene, herein designated VGAM GENE, on one

or more VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86195] It is yet further appreciated that a function of VGAM2541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2541 correlate with, and may be deduced from, the identity of the host target genes which VGAM2541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86196] Nucleotide sequences of the VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2541 are further described hereinbelow with reference to Table 1.

[86197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2541 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86198] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2541 gene, herein designated VGAM is inhibition of expression of VGAM2541 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2541 correlate with, and may be deduced from, the identity of the target genes which VGAM2541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86199] Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Ac-

cession NM_005065) is a VGAM2541 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:11501, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86200] A function of VGAM2541 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065), a gene which may play a role in notch signaling (by similarity). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM245.DKFZP434E2135 (Accession NM_030804) is another VGAM2541 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25114, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86201] Another function of VGAM2541 is therefore inhibition of DKFZP434E2135 (Accession NM_030804). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. FLJ20958 (Accession NM_022102) is another VGAM2541 host target gene. FLJ20958 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20958 BINDING SITE, designated SEQ ID:22646, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86202] Another function of VGAM2541 is therefore inhibition of FLJ20958 (Accession NM_022102). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20958. FLJ22833 (Accession NM_022837) is another VGAM2541 host target gene. FLJ22833 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22833 BINDING SITE, designated SEQ ID:23121, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86203] Another function of VGAM2541 is therefore inhibition of FLJ22833 (Accession NM_022837). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22833. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445) is another VGAM2541 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GRIN3A BINDING SITE, designated SEQ ID:28528, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86204] Another function of VGAM2541 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA0240 (Accession XM_166479) is another VGAM2541 host target gene. KIAA0240 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0240 BINDING SITE, designated SEQ ID:44405, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86205] Another function of VGAM2541 is therefore inhibition of KIAA0240 (Accession XM_166479). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0240. KIAA1247 (Accession XM_030036) is another

VGAM2541 host target gene. KIAA1247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1247 BINDING SITE, designated SEQ ID:30987, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86206] Another function of VGAM2541 is therefore inhibition of KIAA1247 (Accession XM_030036). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1247. KIAA1944 (Accession XM_062545) is another VGAM2541 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37225, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86207] Another function of VGAM2541 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. LBP-9 (Accession NM_014553) is another VGAM2541 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15874, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86208] Another function of VGAM2541 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. RAI (Accession NM_006663) is another VGAM2541 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13467, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86209] Another function of VGAM2541 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. RES4-25 (Accession XM_035572) is another VGAM2541 host target gene. RES4-25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RES4-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RES4-25 BINDING SITE, designated SEQ ID:32286, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86210] Another function of VGAM2541 is therefore inhibition of RES4-25 (Accession XM_035572). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RES4-25. Syndecan 3 (N-syndecan) (SDC3, Accession

NM_014654) is another VGAM2541 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16075, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86211] Another function of VGAM2541 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM2541 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27102

and SEQ ID:36113 respectively, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86212] Another function of VGAM2541 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC144563 (Accession XM_084897) is another VGAM2541 host target gene. LOC144563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144563 BINDING SITE, designated SEQ ID:37766, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86213] Another function of VGAM2541 is therefore inhibition of LOC144563 (Accession XM_084897). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144563. LOC146780 (Accession XM_097086) is an-

other VGAM2541 host target gene. LOC146780 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146780, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146780 BINDING SITE, designated SEQ ID:40742, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86214] Another function of VGAM2541 is therefore inhibition of LOC146780 (Accession XM_097086). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146780. LOC151632 (Accession XM_098098) is another VGAM2541 host target gene. LOC151632 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151632 BINDING SITE, designated SEQ ID:41381, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86215] Another function of VGAM2541 is therefore inhibition of LOC151632 (Accession XM_098098). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151632. LOC161829 (Accession XM_091161) is another VGAM2541 host target gene. LOC161829 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161829 BINDING SITE, designated SEQ ID:40037, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86216] Another function of VGAM2541 is therefore inhibition of LOC161829 (Accession XM_091161). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161829. LOC164714 (Accession XM_104657) is another VGAM2541 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42173, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86217] Another function of VGAM2541 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC200904 (Accession XM_117291) is another VGAM2541 host target gene. LOC200904 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200904 BINDING SITE, designated SEQ ID:43360, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86218] Another function of VGAM2541 is therefore inhibition of LOC200904 (Accession XM_117291). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200904. LOC201252 (Accession XM_113941) is another VGAM2541 host target gene. LOC201252 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201252 BINDING SITE, designated SEQ ID:42555, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86219] Another function of VGAM2541 is therefore inhibition of LOC201252 (Accession XM_113941). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201252. LOC203083 (Accession XM_117496) is another VGAM2541 host target gene. LOC203083 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203083 BINDING SITE, designated SEQ ID:43478, to the nucleotide sequence of VGAM2541 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5252.

[86220] Another function of VGAM2541 is therefore inhibition of LOC203083 (Accession XM_117496). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203083. LOC219919 (Accession XM_167785) is another VGAM2541 host target gene. LOC219919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219919 BINDING SITE, designated SEQ ID:44800, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86221] Another function of VGAM2541 is therefore inhibition of LOC219919 (Accession XM_167785). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219919. LOC221795 (Accession XM_166491) is another VGAM2541 host target gene. LOC221795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221795, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221795 BINDING SITE, designated SEQ ID:44423, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86222] Another function of VGAM2541 is therefore inhibition of LOC221795 (Accession XM_166491). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221795. LOC221810 (Accession XM_168222) is another VGAM2541 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:45081, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86223] Another function of VGAM2541 is therefore inhibition of LOC221810 (Accession XM_168222). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221810. LOC254176 (Accession XM_173215) is another VGAM2541 host target gene. LOC254176 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254176 BINDING SITE, designated SEQ ID:46475, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86224] Another function of VGAM2541 is therefore inhibition of LOC254176 (Accession XM_173215). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254176. LOC256515 (Accession XM_172866) is another VGAM2541 host target gene. LOC256515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256515 BINDING SITE, designated SEQ ID:46144, to

the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86225] Another function of VGAM2541 is therefore inhibition of LOC256515 (Accession XM_172866). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256515. LOC256594 (Accession XM_173127) is another VGAM2541 host target gene. LOC256594 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256594 BINDING SITE, designated SEQ ID:46377, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86226] Another function of VGAM2541 is therefore inhibition of LOC256594 (Accession XM_173127). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256594. LOC57406 (Accession NM_020676) is another VGAM2541 host target gene. LOC57406 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC57406, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57406 BINDING SITE, designated SEQ ID:21838, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86227] Another function of VGAM2541 is therefore inhibition of LOC57406 (Accession NM_020676). Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57406. LOC92578 (Accession XM_045900) is another VGAM2541 host target gene. LOC92578 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92578 BINDING SITE, designated SEQ ID:34606, to the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, also designated SEQ ID:5252.

[86228] Another function of VGAM2541 is therefore inhibition of LOC92578 (Accession XM_045900). Accordingly, utilities

of VGAM2541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2542 (VGAM2542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86229] VGAM2542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2542 was detected is described hereinabove with reference to Figs. 1-8.

[86230] VGAM2542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86231] VGAM2542 gene encodes a VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2542 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2542 precursor RNA is desig-

nated SEQ ID:2528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2528 is located at position 9086 relative to the genome of Langat Virus.

[86232] VGAM2542 precursor RNA folds onto itself, forming VGAM2542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86233] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2542 folded precursor RNA into VGAM2542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2542 RNA is designated SEQ ID:5253, and is provided hereinbelow with reference to the sequence

listing part.

[86234] VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2542 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86235] VGAM2542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2542 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2542 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86236] The complementary binding of VGAM2542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2542 host target RNA into VGAM2542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86237] It is appreciated that VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2542 host target genes. The mRNA of each one of this plurality of VGAM2542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2542 RNA, herein designated VGAM

RNA, and which when bound by VGAM2542 RNA causes inhibition of translation of respective one or more VGAM2542 host target proteins.

[86238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2542 gene, herein designated VGAM GENE, on one or more VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86239] It is yet further appreciated that a function of VGAM2542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2542 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2542 correlate with, and may be deduced from, the identity of the host target genes which VGAM2542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86240] Nucleotide sequences of the VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2542 are further described hereinbelow with reference to Table 1.

[86241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2542 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2542 gene, herein designated VGAM is

inhibition of expression of VGAM2542 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2542 correlate with, and may be deduced from, the identity of the target genes which VGAM2542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86243] Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM_000681) is a VGAM2542 host target gene. ADRA2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADRA2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2A BINDING SITE, designated SEQ ID:6336, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86244] A function of VGAM2542 is therefore inhibition of Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM_000681), a gene which mediates the effects of epinephrine and norepinephrine. Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ADRA2A. The function of ADRA2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM602.SMURF1 (Accession XM_166483) is another VGAM2542 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44412, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86245] Another function of VGAM2542 is therefore inhibition of SMURF1 (Accession XM_166483). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. BM039 (Accession NM_018455) is another VGAM2542 host target gene. BM039 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BM039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of BM039 BINDING SITE, designated SEQ ID:20527, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86246] Another function of VGAM2542 is therefore inhibition of BM039 (Accession NM_018455). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM039. DKFZP434A0131 (Accession NM_018991) is another VGAM2542 host target gene. DKFZP434A0131 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434A0131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A0131 BINDING SITE, designated SEQ ID:21063, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86247] Another function of VGAM2542 is therefore inhibition of DKFZP434A0131 (Accession NM_018991). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434A0131. FLJ00001 (Accession XM_088525) is another VGAM2542 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39772, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86248] Another function of VGAM2542 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ14249 (Accession NM_022460) is another VGAM2542 host target gene. FLJ14249 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE, designated SEQ ID:22797, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM

RNA, also designated SEQ ID:5253.

[86249] Another function of VGAM2542 is therefore inhibition of FLJ14249 (Accession NM_022460). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249. Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM_004983) is another VGAM2542 host target gene. KCNJ9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNJ9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ9 BINDING SITE, designated SEQ ID:11432, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86250] Another function of VGAM2542 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM_004983). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ9. KIAA0789 (Accession XM_033113) is another VGAM2542 host target gene. KIAA0789 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31843, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86251] Another function of VGAM2542 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. Synaptotagmin XII (SYT12, Accession XM_170657) is another VGAM2542 host target gene. SYT12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT12 BINDING SITE, designated SEQ ID:45430, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86252] Another function of VGAM2542 is therefore inhibition of Synaptotagmin XII (SYT12, Accession XM_170657). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT12. TED (Accession NM_015686) is another VGAM2542 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17911, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86253] Another function of VGAM2542 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. Ubiquitin Specific Protease 20 (USP20, Accession NM_006676) is another VGAM2542 host target gene. USP20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP20, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:13501, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86254] Another function of VGAM2542 is therefore inhibition of Ubiquitin Specific Protease 20 (USP20, Accession NM_006676). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20. LOC135398 (Accession XM_069333) is another VGAM2542 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37384, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86255] Another function of VGAM2542 is therefore inhibition of LOC135398 (Accession XM_069333). Accordingly, utilities

of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC164537 (Accession XM_104534) is another VGAM2542 host target gene. LOC164537 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164537 BINDING SITE, designated SEQ ID:42171, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86256] Another function of VGAM2542 is therefore inhibition of LOC164537 (Accession XM_104534). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164537. LOC169021 (Accession XM_095459) is another VGAM2542 host target gene. LOC169021 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC169021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC169021 BINDING SITE, designated SEQ ID:40256, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86257] Another function of VGAM2542 is therefore inhibition of LOC169021 (Accession XM_095459). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169021. LOC205095 (Accession XM_119820) is another VGAM2542 host target gene. LOC205095 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC205095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205095 BINDING SITE, designated SEQ ID:43601, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86258] Another function of VGAM2542 is therefore inhibition of LOC205095 (Accession XM_119820). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205095. LOC58525 (Accession XM_086045) is another VGAM2542 host target gene. LOC58525 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC58525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:38454, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86259] Another function of VGAM2542 is therefore inhibition of LOC58525 (Accession XM_086045). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525. LOC90246 (Accession XM_030283) is another VGAM2542 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:30998, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86260] Another function of VGAM2542 is therefore inhibition of

LOC90246 (Accession XM_030283). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. LOC92017 (Accession XM_042234) is another VGAM2542 host target gene. LOC92017 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:33709, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86261] Another function of VGAM2542 is therefore inhibition of LOC92017 (Accession XM_042234). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017. LOC93166 (Accession XM_049619) is another VGAM2542 host target gene. LOC93166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC93166 BINDING SITE, designated SEQ ID:35458, to the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, also designated SEQ ID:5253.

[86262] Another function of VGAM2542 is therefore inhibition of LOC93166 (Accession XM_049619). Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2543 (VGAM2543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86263] VGAM2543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2543 was detected is described hereinabove with reference to Figs. 1-8.

[86264] VGAM2543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86265] VGAM2543 gene encodes a VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2543 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2543 precursor RNA is designated SEQ ID:2529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2529 is located at position 976 relative to the genome of Langat Virus.

[86266] VGAM2543 precursor RNA folds onto itself, forming VGAM2543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2543 folded precursor RNA into VGAM2543 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2543 RNA is designated SEQ ID:5254, and is provided hereinbelow with reference to the sequence listing part.

[86268] VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2543 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86269] VGAM2543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2543 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86270] The complementary binding of VGAM2543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2543 host target RNA into VGAM2543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86271] It is appreciated that VGAM2543 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2543 host target genes. The mRNA of each one of this plurality of VGAM2543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2543 RNA, herein designated VGAM RNA, and which when bound by VGAM2543 RNA causes inhibition of translation of respective one or more VGAM2543 host target proteins.

[86272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2543 gene, herein designated VGAM GENE, on one or more VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86273] It is yet further appreciated that a function of VGAM2543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2543 correlate with, and may be deduced from, the identity of the host target genes which VGAM2543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86274] Nucleotide sequences of the VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2543 are further described hereinbelow with reference to Table 1.

[86275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2543 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2543 gene, herein designated VGAM is inhibition of expression of VGAM2543 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2543 correlate with, and may be deduced from, the identity of the target genes which VGAM2543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86277] Endothelin 3 (EDN3, Accession NM_000114) is a VGAM2543 host target gene. EDN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDN3 BINDING SITE, designated SEQ ID:5580, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86278] A function of VGAM2543 is therefore inhibition of En-

dothelin 3 (EDN3, Accession NM_000114). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN3. Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169) is another VGAM2543 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40304, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86279] Another function of VGAM2543 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169), a gene which hydrolyzes Ins(1,3,4,5)P4 and PtdIns(3,4,5)P3; contains an SH2-domain. Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM64.Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession NM_002298) is another VGAM2543 host target gene. LCP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCP1 BINDING SITE, designated SEQ ID:8083, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86280] Another function of VGAM2543 is therefore inhibition of Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession NM_002298), a gene which is involved in t cell antigen receptor mediated signaling. Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCP1. The function of LCP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM418.Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2543 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33032, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86281] Another function of VGAM2543 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FASTK (Accession NM_025096) is another VGAM2543 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24727, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86282] Another function of VGAM2543 is therefore inhibition of FASTK (Accession NM_025096). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK. FLJ20004 (Accession XM_170889) is another VGAM2543 host target gene. FLJ20004 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:45643, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86283] Another function of VGAM2543 is therefore inhibition of FLJ20004 (Accession XM_170889). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004. KIAA0914 (Accession NM_014883) is another VGAM2543 host target gene. KIAA0914 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0914, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0914 BINDING SITE, designated SEQ ID:17035, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86284] Another function of VGAM2543 is therefore inhibition of KIAA0914 (Accession NM_014883). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0914. KIAA1030 (Accession XM_167789) is another VGAM2543 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:44819, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86285] Another function of VGAM2543 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1030. l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201) is another VGAM2543 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ ID:42787, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86286] Another function of VGAM2543 is therefore inhibition of l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. MGC15631 (Accession NM_032753) is another VGAM2543 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, desig-

nated SEQ ID:26491, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86287] Another function of VGAM2543 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. SCAMP5 (Accession NM_138967) is another VGAM2543 host target gene. SCAMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:29073, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86288] Another function of VGAM2543 is therefore inhibition of SCAMP5 (Accession NM_138967). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. STATI2 (Accession XM_170547) is another VGAM2543 host target gene. STATI2 BINDING SITE1 and

STATI2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STATI2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STATI2 BINDING SITE1 and STATI2 BINDING SITE2, designated SEQ ID:45370 and SEQ ID:9959 respectively, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86289] Another function of VGAM2543 is therefore inhibition of STATI2 (Accession XM_170547). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STATI2. LOC196510 (Accession XM_113738) is another VGAM2543 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:42393, to the nucleotide sequence of VGAM2543 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5254.

[86290] Another function of VGAM2543 is therefore inhibition of LOC196510 (Accession XM_113738). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196510. LOC200093 (Accession XM_032184) is another VGAM2543 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31596, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86291] Another function of VGAM2543 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC200220 (Accession XM_114157) is another VGAM2543 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200220, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:42742, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86292] Another function of VGAM2543 is therefore inhibition of LOC200220 (Accession XM_114157). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC203536 (Accession XM_114716) is another VGAM2543 host target gene. LOC203536 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203536 BINDING SITE, designated SEQ ID:43056, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86293] Another function of VGAM2543 is therefore inhibition of LOC203536 (Accession XM_114716). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC203536. LOC91149 (Accession XM_036480) is another VGAM2543 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32454, to the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, also designated SEQ ID:5254.

[86294] Another function of VGAM2543 is therefore inhibition of LOC91149 (Accession XM_036480). Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2544 (VGAM2544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86295] VGAM2544 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2544 was detected is described hereinabove with reference to Figs. 1-8.

[86296] VGAM2544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86297] VGAM2544 gene encodes a VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2544 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2544 precursor RNA is designated SEQ ID:2530, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2530 is located at position 9387 relative to the genome of Langat Virus.

[86298] VGAM2544 precursor RNA folds onto itself, forming VGAM2544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86299] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2544 folded precursor RNA into VGAM2544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2544 RNA is designated SEQ ID:5255, and is provided hereinbelow with reference to the sequence listing part.

[86300] VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2544 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86301] VGAM2544 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2544 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86302] The complementary binding of VGAM2544 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2544 host target RNA into VGAM2544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86303] It is appreciated that VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2544 host target genes. The mRNA of each one of this plurality of VGAM2544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2544 RNA, herein designated VGAM RNA, and which when bound by VGAM2544 RNA causes inhibition of translation of respective one or more VGAM2544 host target proteins.

[86304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2544 gene, herein designated VGAM GENE, on one or more VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86305] It is yet further appreciated that a function of VGAM2544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2544 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2544 correlate with, and may be deduced from, the identity of the host target genes which VGAM2544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86306] Nucleotide sequences of the VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2544 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2544 are further described hereinbelow with reference to Table 1.

[86307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2544 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2544 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86308] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2544 gene, herein designated VGAM is inhibition of expression of VGAM2544 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2544 correlate with, and may be deduced from, the identity of the target genes which VGAM2544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86309] Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548) is a VGAM2544 host target gene. BPAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BPAG1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPAG1 BINDING SITE, designated SEQ ID:17810, to the nucleotide sequence of VGAM2544 RNA, herein designated VGAM RNA, also designated SEQ ID:5255.

[86310] A function of VGAM2544 is therefore inhibition of Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548), a gene which plays a role in cross- linking actin to other cytoskeletal proteins, binds to microtubules. Accordingly, utilities of VGAM2544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPAG1. The function of BPAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM_024408) is another VGAM2544 host target gene. NOTCH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOTCH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of NOTCH2 BINDING SITE, designated SEQ ID:23650, to the nucleotide sequence of VGAM2544 RNA, herein designated VGAM RNA, also designated SEQ ID:5255.

[86311] Another function of VGAM2544 is therefore inhibition of Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM_024408), a gene which is moderately similar to a region of murine Notch1 and contains an ankyrin repeat. Accordingly, utilities of VGAM2544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH2. The function of NOTCH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM2544 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10475, to the nucleotide sequence of

VGAM2544 RNA, herein designated VGAM RNA, also designated SEQ ID:5255.

[86312] Another function of VGAM2544 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM2544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2545 (VGAM2545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86313] VGAM2545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2545 was detected is described hereinabove with reference to Figs. 1-8.

[86314] VGAM2545 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86315] VGAM2545 gene encodes a VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2545 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2545 precursor RNA is designated SEQ ID:2531, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2531 is located at position 3636 relative to the genome of Langat Virus.

[86316] VGAM2545 precursor RNA folds onto itself, forming VGAM2545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86317] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2545 folded precursor RNA into VGAM2545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2545 RNA is designated SEQ ID:5256, and is provided hereinbelow with reference to the sequence listing part.

[86318] VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2545 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86319] VGAM2545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2545 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86320] The complementary binding of VGAM2545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2545 host target RNA into VGAM2545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86321] It is appreciated that VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2545 host target genes. The mRNA of

each one of this plurality of VGAM2545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2545 RNA, herein designated VGAM RNA, and which when bound by VGAM2545 RNA causes inhibition of translation of respective one or more VGAM2545 host target proteins.

[86322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2545 gene, herein designated VGAM GENE, on one or more VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[86323] It is yet further appreciated that a function of VGAM2545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2545 correlate with, and may be deduced from, the identity of the host target genes which VGAM2545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86324] Nucleotide sequences of the VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2545 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2545 are further described hereinbelow with reference to Table 1.

[86325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2545 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2545 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86326] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2545 gene, herein designated VGAM is inhibition of expression of VGAM2545 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2545 correlate with, and may be deduced from, the identity of the target genes which VGAM2545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86327] Heat Shock Transcription Factor 2 Binding Protein (HSF2BP, Accession NM_007031) is a VGAM2545 host target gene. HSF2BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSF2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSF2BP BINDING SITE, designated SEQ ID:13896, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86328] A function of VGAM2545 is therefore inhibition of Heat Shock Transcription Factor 2 Binding Protein (HSF2BP, Ac-

cession NM_007031). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSF2BP. Myeloid Differentiation Primary Response Gene (88) (MYD88, Accession NM_002468) is another VGAM2545 host target gene. MYD88 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYD88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYD88 BINDING SITE, designated SEQ ID:8295, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86329] Another function of VGAM2545 is therefore inhibition of Myeloid Differentiation Primary Response Gene (88) (MYD88, Accession NM_002468), a gene which is involved in the toll-like receptor and il-1 receptor signaling pathway in the innate immune response. Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYD88. The function of MYD88 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM18.Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM_002832) is another VGAM2545 host target gene. PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPN7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3, designated SEQ ID:8709, SEQ ID:27887 and SEQ ID:27890 respectively, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86330] Another function of VGAM2545 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM_002832). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN7. Synuclein, Alpha Interacting Protein (synphilin) (SNCAIP, Accession XM_171090) is another VGAM2545 host target gene. SNCAIP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

SNCAIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNCAIP BINDING SITE, designated SEQ ID:45903, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86331] Another function of VGAM2545 is therefore inhibition of Synuclein, Alpha Interacting Protein (synphilin) (SNCAIP, Accession XM_171090), a gene which promotes formation of cytosolic inclusions in neurons. Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNCAIP. The function of SNCAIP has been established by previous studies. Parkinson disease (PD) is a neurodegenerative disease characterized by tremor, bradykinesia, rigidity, and postural instability. Postmortem examination shows loss of neurons and Lewy bodies, which are cytoplasmic eosinophilic inclusions, in the substantia nigra and other brain regions. A few families have been found to have PD on the basis of mutations, A53T (163890.0001) or A30P (163890.0002), in the gene encoding alpha-synuclein (SNCA). Alpha-synuclein is present in Lewy bodies of pa-

tients with sporadic PD, suggesting that alpha-synuclein may be involved in the pathogenesis of PD. To determine the protein-interaction partners of alpha-synuclein, Engelender et al. (1999) screened human brain libraries in the yeast 2-hybrid system. They identified a novel interacting protein they designated synphilin-1, encoded by the gene SNCAIP. The predicted 919-amino acid synphilin-1 protein contains several protein-protein interaction domains, such as ankyrin-like repeats and a coiled-coil domain. An approximately 4-kb SNCAIP transcript was detected in many human tissues by Northern blot analysis and was particularly enriched in brain, heart, and placenta. Synphilin-1 was present in many regions in brain, including substantia nigra. In immunoblot analyses of human brain, synphilin-1 appeared as a single band of approximately 90 kD in several brain regions, with no differences in the level of expression in controls, patients with PD, or patients with Alzheimer disease (OMIM Ref. No. 104300). They found that alpha-synuclein interacts in vivo with synphilin-1 in neurons. Cotransfection of both proteins (but not control proteins) in HEK293 cells yielded cytoplasmic eosinophilic inclusions. Engelender et al. (2000) determined that the human SNCAIP gene contains 10 ex-

ons and has a highly polymorphic GT repeat within intron 5 that is suitable for linkage analysis in families with Parkinson disease. Using immunohistochemistry in human postmortem brain tissue, they found that synphilin-1 protein, like alpha-synuclein protein, is present in neuropil.

[86332] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[86333] Engelender, S.; Kaminsky, Z.; Guo, X.; Sharp, A. H.; Amaravi, R. K.; Kleiderlein, J. J.; Margolis, R. L.; Troncoso, J. C.; Lanahan, A. A.; Worley, P. F.; Dawson, V. L.; Dawson, T. M.; Ross, C. A. : Synphilin-1 associates with alpha-synuclein and promotes the formation of cytosolic inclusions. Nature Genet. 22: 110-114, 1999. ; and

[86334] Engelender, S.; Wanner, T.; Kleiderlein, J. J.; Wakabayashi, K.; Tsuji, S.; Takahashi, H.; Ashworth, R.; Margolis, R. L.; Ross, C. A. : Organization of the human synphilin-1 gene, a ca.

[86335] Further studies establishing the function and utilities of SNCAIP are found in John Hopkins OMIM database record ID 603779, and in sited publications numbered 244 and 8193 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Butyrophilin,

Subfamily 2, Member A2 (BTN2A2, Accession NM_006995) is another VGAM2545 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:13857, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86336] Another function of VGAM2545 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM_006995). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2. DKFZP434A0131 (Accession NM_018991) is another VGAM2545 host target gene. DKFZP434A0131 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434A0131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A0131 BINDING SITE, designated SEQ ID:21061, to the nucleotide

sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86337] Another function of VGAM2545 is therefore inhibition of DKFZP434A0131 (Accession NM_018991). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A0131. F-box Only Protein 27 (FBXO27, Accession XM_059045) is another VGAM2545 host target gene. FBXO27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36833, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86338] Another function of VGAM2545 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM_059045). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27. FLJ31762 (Accession NM_144601) is another VGAM2545 host target gene.

FLJ31762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31762 BINDING SITE, designated SEQ ID:29417, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86339] Another function of VGAM2545 is therefore inhibition of FLJ31762 (Accession NM_144601). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31762. KIAA0057 (Accession NM_012288) is another VGAM2545 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14620, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86340] Another function of VGAM2545 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. PAX Transcription Activation Domain Interacting Protein 1 Like (PAXIP1L, Accession XM_046538) is another VGAM2545 host target gene. PAXIP1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAXIP1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAXIP1L BINDING SITE, designated SEQ ID:34738, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86341] Another function of VGAM2545 is therefore inhibition of PAX Transcription Activation Domain Interacting Protein 1 Like (PAXIP1L, Accession XM_046538). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAXIP1L. PRO0456 (Accession NM_014127) is another VGAM2545 host target gene. PRO0456 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PRO0456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0456 BINDING SITE, designated SEQ ID:15394, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86342] Another function of VGAM2545 is therefore inhibition of PRO0456 (Accession NM_014127). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0456. PRO2964 (Accession NM_018547) is another VGAM2545 host target gene. PRO2964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2964 BINDING SITE, designated SEQ ID:20630, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86343] Another function of VGAM2545 is therefore inhibition of PRO2964 (Accession NM_018547). Accordingly, utilities of

VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2964. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM2545 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11276, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86344] Another function of VGAM2545 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107) is another VGAM2545 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSR3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13970, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86345] Another function of VGAM2545 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. Zinc Finger Protein 145 (Kruppel-like, expressed in promyelocytic leukemia) (ZNF145, Accession NM_006006) is another VGAM2545 host target gene. ZNF145 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF145 BINDING SITE, designated SEQ ID:12617, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86346] Another function of VGAM2545 is therefore inhibition of Zinc Finger Protein 145 (Kruppel-like, expressed in promyelocytic leukemia) (ZNF145, Accession NM_006006). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF145. LOC115073 (Accession XM_055193) is another VGAM2545 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36238, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86347] Another function of VGAM2545 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC145719 (Accession XM_096848) is another VGAM2545 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40570, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86348] Another function of VGAM2545 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM2545 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40560, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86349] Another function of VGAM2545 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities

of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC197114 (Accession XM_116987) is another VGAM2545 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43184, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86350] Another function of VGAM2545 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC197117 (Accession XM_116989) is another VGAM2545 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC197117 BINDING SITE, designated SEQ ID:43193, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86351] Another function of VGAM2545 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. LOC222252 (Accession XM_168640) is another VGAM2545 host target gene. LOC222252 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222252 BINDING SITE, designated SEQ ID:45286, to the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, also designated SEQ ID:5256.

[86352] Another function of VGAM2545 is therefore inhibition of LOC222252 (Accession XM_168640). Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2546 (VGAM2546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86353] VGAM2546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2546 was detected is described hereinabove with reference to Figs. 1-8.

[86354] VGAM2546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86355] VGAM2546 gene encodes a VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2546 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2546 precursor RNA is designated SEQ ID:2532, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2532 is located at position 3420 relative to the genome of Langat Virus.

[86356] VGAM2546 precursor RNA folds onto itself, forming VGAM2546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86357] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2546 folded precursor RNA into VGAM2546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2546 RNA is designated SEQ ID:5257, and is provided hereinbelow with reference to the sequence listing part.

[86358] VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2546 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2546 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86359] VGAM2546 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2546 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86360] The complementary binding of VGAM2546 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2546 host target RNA into VGAM2546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86361] It is appreciated that VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2546 host target genes. The mRNA of each one of this plurality of VGAM2546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2546 RNA, herein designated VGAM RNA, and which when bound by VGAM2546 RNA causes inhibition of translation of respective one or more VGAM2546 host target proteins.

[86362] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2546 gene, herein designated VGAM GENE, on one or more VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86363] It is yet further appreciated that a function of VGAM2546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2546 correlate with, and may be deduced from, the identity of the host

target genes which VGAM2546 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[86364] Nucleotide sequences of the VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2546 are further described hereinbelow with reference to Table 1.

[86365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2546 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86366] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2546 gene, herein designated VGAM is inhibition of expression of VGAM2546 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2546 correlate with, and may be deduced from, the identity of the target genes which VGAM2546

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86367] CGTHBA (Accession NM_012075) is a VGAM2546 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14358, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86368] A function of VGAM2546 is therefore inhibition of CGTHBA (Accession NM_012075). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680) is another VGAM2546 host target gene. COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL11A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2, designated SEQ ID:27975 and SEQ ID:27980 respectively, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86369] Another function of VGAM2546 is therefore inhibition of Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2. FLJ20464 (Accession NM_017834) is another VGAM2546 host target gene. FLJ20464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20464 BINDING SITE, designated SEQ ID:19500, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86370] Another function of VGAM2546 is therefore inhibition of FLJ20464 (Accession NM_017834). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20464. KIAA0515 (Accession XM_033380) is another VGAM2546 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31920, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86371] Another function of VGAM2546 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0542 (Accession XM_038520) is another VGAM2546 host target gene. KIAA0542 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0542 BINDING SITE, designated SEQ ID:32857, to the

nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86372] Another function of VGAM2546 is therefore inhibition of KIAA0542 (Accession XM_038520). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0542. VRP (Accession NM_007063) is another VGAM2546 host target gene. VRP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VRP BINDING SITE, designated SEQ ID:13926, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86373] Another function of VGAM2546 is therefore inhibition of VRP (Accession NM_007063). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VRP. LOC148756 (Accession XM_097516) is another VGAM2546 host target gene. LOC148756 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC148756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148756 BINDING SITE, designated SEQ ID:40902, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86374] Another function of VGAM2546 is therefore inhibition of LOC148756 (Accession XM_097516). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148756. LOC254413 (Accession XM_173141) is another VGAM2546 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46399, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86375] Another function of VGAM2546 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities

of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC255974 (Accession XM_173706) is another VGAM2546 host target gene. LOC255974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255974 BINDING SITE, designated SEQ ID:46555, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86376] Another function of VGAM2546 is therefore inhibition of LOC255974 (Accession XM_173706). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255974. LOC256306 (Accession XM_172976) is another VGAM2546 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256306 BINDING SITE, designated SEQ ID:46235, to the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, also designated SEQ ID:5257.

[86377] Another function of VGAM2546 is therefore inhibition of LOC256306 (Accession XM_172976). Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2547 (VGAM2547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86378] VGAM2547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2547 was detected is described hereinabove with reference to Figs. 1-8.

[86379] VGAM2547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat Virus. VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86380] VGAM2547 gene encodes a VGAM2547 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2547 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2547 precursor RNA is designated SEQ ID:2533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2533 is located at position 6689 relative to the genome of Langat Virus.

[86381] VGAM2547 precursor RNA folds onto itself, forming VGAM2547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2547 folded precursor RNA into VGAM2547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2547 RNA is designated SEQ ID:5258, and is provided hereinbelow with reference to the sequence listing part.

[86383] VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2547 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86384] VGAM2547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2547 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86385] The complementary binding of VGAM2547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2547 host target RNA into VGAM2547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86386] It is appreciated that VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2547 host target genes. The mRNA of each one of this plurality of VGAM2547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2547 RNA, herein designated VGAM RNA, and which when bound by VGAM2547 RNA causes inhibition of translation of respective one or more VGAM2547 host target proteins.

[86387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2547 gene, herein designated VGAM GENE, on one or more VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86388] It is yet further appreciated that a function of VGAM2547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of viral infection by Langat Virus. Specific functions, and accordingly utilities, of VGAM2547 correlate with, and may be deduced from, the identity of the host target genes which VGAM2547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86389] Nucleotide sequences of the VGAM2547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2547 are further described hereinbelow with reference to Table 1.

[86390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2547 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2547 gene, herein designated VGAM is inhibition of expression of VGAM2547 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2547 correlate with, and may be deduced from, the identity of the target genes which VGAM2547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86392] Guanylate Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Accession XM_032838) is a VGAM2547 host target gene. GUCY1A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GUCY1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1A3 BINDING SITE, designated SEQ ID:31779, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86393] A function of VGAM2547 is therefore inhibition of Guany-

late Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Accession XM_032838), a gene which is alpha 1 (alpha 3) subunit of soluble guanylate cyclase and forms a heterodimer with GUCY1B3 that converts GTP to cGMP. Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GUCY1A3. The function of GUCY1A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM_033341) is another VGAM2547 host target gene. BIRC8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIRC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC8 BINDING SITE, designated SEQ ID:27197, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86394] Another function of VGAM2547 is therefore inhibition of Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM_033341). Accordingly, utilities of VGAM2547 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC8. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM2547 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10477, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86395] Another function of VGAM2547 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. FLJ10201 (Accession NM_018023) is another VGAM2547 host target gene. FLJ10201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10201 BINDING SITE, designated SEQ ID:19761, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86396] Another function of VGAM2547 is therefore inhibition of FLJ10201 (Accession NM_018023). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10201. FLJ33069 (Accession NM_144649) is another VGAM2547 host target gene. FLJ33069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ33069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ33069 BINDING SITE, designated SEQ ID:29475, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86397] Another function of VGAM2547 is therefore inhibition of FLJ33069 (Accession NM_144649). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ33069. KIAA0478 (Accession NM_014870) is another VGAM2547 host target gene. KIAA0478 BINDING SITE1 and KIAA0478 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0478, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE1 and KIAA0478 BINDING SITE2, designated SEQ ID:16974 and SEQ ID:16975 respectively, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86398] Another function of VGAM2547 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. LOC130271 (Accession XM_059415) is another VGAM2547 host target gene. LOC130271 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC130271 BINDING SITE, designated SEQ ID:36986, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86399] Another function of VGAM2547 is therefore inhibition of LOC130271 (Accession XM_059415). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130271. LOC143943 (Accession XM_096504) is another VGAM2547 host target gene. LOC143943 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143943 BINDING SITE, designated SEQ ID:40382, to the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, also designated SEQ ID:5258.

[86400] Another function of VGAM2547 is therefore inhibition of LOC143943 (Accession XM_096504). Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143943. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2548 (VGAM2548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86401] VGAM2548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2548 was detected is described hereinabove with reference to Figs. 1-8.

[86402] VGAM2548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces Cerevisiae Virus L-A. VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86403] VGAM2548 gene encodes a VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2548 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2548 precursor RNA is designated SEQ ID:2534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2534 is located at position 4007 relative to the

genome of Saccharomyces Cerevisiae Virus L-A.

[86404] VGAM2548 precursor RNA folds onto itself, forming VGAM2548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2548 folded precursor RNA into VGAM2548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2548 RNA is designated SEQ ID:5259, and is provided hereinbelow with reference to the sequence listing part.

[86406] VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2548 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86407] VGAM2548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2548 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86408] The complementary binding of VGAM2548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2548 host target RNA into VGAM2548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86409] It is appreciated that VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2548 host target genes. The mRNA of each one of this plurality of VGAM2548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2548 RNA, herein designated VGAM RNA, and which when bound by VGAM2548 RNA causes inhibition of translation of respective one or more VGAM2548 host target proteins.

[86410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2548 gene, herein designated VGAM GENE, on one or more VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86411] It is yet further appreciated that a function of VGAM2548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2548 include diagnosis, prevention and treatment of viral infection by Saccharomyces Cerevisiae Virus L-A. Specific functions, and accordingly utilities, of

VGAM2548 correlate with, and may be deduced from, the identity of the host target genes which VGAM2548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86412] Nucleotide sequences of the VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2548 are further described hereinbelow with reference to Table 1.

[86413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2548 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2548 gene, herein designated VGAM is inhibition of expression of VGAM2548 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2548 correlate with, and may be deduced

from, the identity of the target genes which VGAM2548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86415] DKFZP434P0721 (Accession XM_033181) is a VGAM2548 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31867, to the nucleotide sequence of VGAM2548 RNA, herein designated VGAM RNA, also designated SEQ ID:5259.

[86416] A function of VGAM2548 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM2548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. LOC149386 (Accession XM_097631) is another VGAM2548 host target gene. LOC149386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149386 BINDING SITE, designated SEQ ID:40984, to the nucleotide sequence of VGAM2548 RNA, herein designated VGAM RNA, also designated SEQ ID:5259.

[86417] Another function of VGAM2548 is therefore inhibition of LOC149386 (Accession XM_097631). Accordingly, utilities of VGAM2548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149386. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2549 (VGAM2549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86418] VGAM2549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2549 was detected is described hereinabove with reference to Figs. 1-8.

[86419] VGAM2549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces Cerevisiae Virus L-A. VGAM2549 host target gene, herein des-

ignated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86420] VGAM2549 gene encodes a VGAM2549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2549 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2549 precursor RNA is designated SEQ ID:2535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2535 is located at position 2612 relative to the genome of Saccharomyces Cerevisiae Virus L-A.

[86421] VGAM2549 precursor RNA folds onto itself, forming VGAM2549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86422] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2549 folded precursor RNA into VGAM2549

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2549 RNA is designated SEQ ID:5260, and is provided hereinbelow with reference to the sequence listing part.

[86423] VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2549 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86424] VGAM2549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2549 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86425] The complementary binding of VGAM2549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2549 host target RNA into VGAM2549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[86426] It is appreciated that VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2549 host target genes. The mRNA of each one of this plurality of VGAM2549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2549 RNA, herein designated VGAM RNA, and which when bound by VGAM2549 RNA causes inhibition of translation of respective one or more VGAM2549 host target proteins.

[86427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2549 gene, herein designated VGAM GENE, on one or more VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86428] It is yet further appreciated that a function of VGAM2549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of viral infection by Saccharomyces Cerevisiae Virus L-A. Specific functions, and accordingly utilities, of VGAM2549 correlate with, and may be deduced from, the identity of the host target genes which VGAM2549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86429] Nucleotide sequences of the VGAM2549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2549 are further described hereinbelow with reference to Table 1.

[86430] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2549 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86431] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2549 gene, herein designated VGAM is inhibition of expression of VGAM2549 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2549 correlate with, and may be deduced from, the identity of the target genes which VGAM2549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86432] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397) is a VGAM2549 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10645, to the nucleotide sequence of

VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86433] A function of VGAM2549 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM_004513) is another VGAM2549 host target gene. IL16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:10840, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86434] Another function of VGAM2549 is therefore inhibition of

Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM_004513), a gene which modulates T-cell activation. Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16. The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM819.Kinesin Family Member 5B (KIF5B, Accession NM_004521) is another VGAM2549 host target gene. KIF5B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIF5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5B BINDING SITE, designated SEQ ID:10850, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86435] Another function of VGAM2549 is therefore inhibition of Kinesin Family Member 5B (KIF5B, Accession NM_004521), a gene which is a microtubule-associated force-producing protein that may play a role in organelle transport. Accordingly, utilities of VGAM2549 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with KIF5B. The function of KIF5B has been established by previous studies. Kinesins are microtubule-based motor proteins involved in the transport of organelles in eukaryotic cells. They typically consist of 2 identical, approximately 110- to 120-kD heavy chains and 2 identical, approximately 60- to 70-kD light chains. The heavy chain contains 3 domains: a globular N-terminal motor domain, which converts the chemical energy of ATP into a motile force along microtubules in 1 fixed direction; a central alpha-helical rod domain, which enables the 2 heavy chains to dimerize; and a globular C-terminal domain, which interacts with light chains and possibly an organelle receptor. By screening a human placenta cDNA library with a probe based on a conserved region of the Drosophila and squid kinesin heavy chains (KHCs), Navone et al. (1992) isolated cDNAs encoding KNS1. The predicted 963-amino acid protein has 63% sequence identity to the Drosophila KHC. Immunoblot analysis using antibodies against squid KHC detected a 120-kD protein in CV-1 monkey kidney epithelial cells. Immunofluorescence studies showed that KNS1 expressed in CV-1 cells had both a diffuse distribution and a fila-

mentous staining pattern that coaligned with microtubules but not vimentin (VIM; 193060) intermediate filaments; the KNS1 N- and C-terminal domains, but not the alpha-helical rod domain, also colocalized with microtubules. Kamal et al. (2000) demonstrated that the axonal transport of APP in neurons is mediated by the direct binding of APP to the kinesin light chain (OMIM Ref. No. 600025) subunit of kinesin-I. Kamal et al. (2001) identified an axonal membrane compartment that contains APP, beta-secretase (OMIM Ref. No. 604252), and presenilin-1 (OMIM Ref. No. 104311). The fast anterograde axonal transport of this compartment is mediated by APP and kinesin-I. Proteolytic processing of APP can occur in the compartment in vitro and in vivo in axons. This proteolysis generates amyloid-beta and a carboxy-terminal fragment of APP, and liberates kinesin-I from the membrane. Kamal et al. (2001) concluded that APP functions as a kinesin-I membrane receptor, mediating the axonal transport of beta-secretase and presenilin-1, and that processing of APP to amyloid-beta by secretases can occur in an axonal membrane compartment transported by kinesin-I. Animal model experiments lend further support to the function of KIF5B. Tanaka et al. (1998) disrupted

the mouse kif5B gene by homologous recombination. The kif5B -/- mice were embryonic lethal with a severe growth retardation at 9.5 to 11.5 days postcoitum. To analyze the significance of this conventional kinesin heavy chain in organelle transport, the authors studied the distribution of major organelles in the extraembryonic cells. The null mutant cells impaired lysosomal dispersion, while brefeldin A could normally induce the breakdown of their Golgi apparatus. More prominently, their mitochondria abnormally clustered in the perinuclear region. This mitochondrial phenotype was reversed by an exogenous expression of KIF5B, and a subcellular fractionation revealed that KIF5B was associated with mitochondria. These data indicated that kinesin is essential for mitochondrial and lysosomal dispersion rather than for the Golgi-to-endoplasmic reticulum traffic in these cells.

[86436] It is appreciated that the abovementioned animal model for KIF5B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[86437] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[86438] Kamal, A.; Stokin, G. B.; Yang, Z.; Xia, C.; Goldstein, L. S. : Axonal transport of amyloid precursor protein is mediated by direct binding to the kinesin light chain subunit of kinesin-I. Neuron 28: 449-459, 2000. ; and

[86439] Navone, F.; Niclas, J.; Hom-Booher, N.; Sparks, L.; Bernstein, H. D.; McCaffrey, G.; Vale, R. D. : Cloning and expression of a human kinesin heavy chain gene: interaction of the COOH-te.

[86440] Further studies establishing the function and utilities of KIF5B are found in John Hopkins OMIM database record ID 602809, and in sited publications numbered 12307-1055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Oxidative-stress Responsive 1 (OSR1, Accession NM_005109) is another VGAM2549 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11587, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86441] Another function of VGAM2549 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM_005109), a gene which mediats stress-activated signals. Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538.APEG1 (Accession XM_050966) is another VGAM2549 host target gene. APEG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APEG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APEG1 BINDING SITE, designated SEQ ID:35694, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86442] Another function of VGAM2549 is therefore inhibition of APEG1 (Accession XM_050966). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APEG1.

Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM2549 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11115, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86443] Another function of VGAM2549 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. FLJ10853 (Accession NM_018246) is another VGAM2549 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated

SEQ ID:20211, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86444] Another function of VGAM2549 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. KIAA0397 (Accession XM_029438) is another VGAM2549 host target gene. KIAA0397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0397 BINDING SITE, designated SEQ ID:30896, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86445] Another function of VGAM2549 is therefore inhibition of KIAA0397 (Accession XM_029438). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0397. KIAA1344 (Accession XM_051699) is another VGAM2549 host target gene. KIAA1344 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35869, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86446] Another function of VGAM2549 is therefore inhibition of KIAA1344 (Accession XM_051699). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. TED (Accession NM_015686) is another VGAM2549 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17919, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86447] Another function of VGAM2549 is therefore inhibition of

TED (Accession NM_015686). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. LOC147229 (Accession XM_085742) is another VGAM2549 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38319, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86448] Another function of VGAM2549 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. LOC219722 (Accession XM_167593) is another VGAM2549 host target gene. LOC219722 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44710, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86449] Another function of VGAM2549 is therefore inhibition of LOC219722 (Accession XM_167593). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. LOC253758 (Accession XM_173067) is another VGAM2549 host target gene. LOC253758 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253758 BINDING SITE, designated SEQ ID:46321, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86450] Another function of VGAM2549 is therefore inhibition of LOC253758 (Accession XM_173067). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253758. LOC253955 (Accession XM_170486) is an-

other VGAM2549 host target gene. LOC253955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253955 BINDING SITE, designated SEQ ID:45327, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86451] Another function of VGAM2549 is therefore inhibition of LOC253955 (Accession XM_170486). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253955. LOC51026 (Accession NM_016072) is another VGAM2549 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18140, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86452] Another function of VGAM2549 is therefore inhibition of LOC51026 (Accession NM_016072). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. LOC91574 (Accession XM_039310) is another VGAM2549 host target gene. LOC91574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91574 BINDING SITE, designated SEQ ID:33047, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86453] Another function of VGAM2549 is therefore inhibition of LOC91574 (Accession XM_039310). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91574. LOC92231 (Accession XM_043734) is another VGAM2549 host target gene. LOC92231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92231, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92231 BINDING SITE, designated SEQ ID:34010, to the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, also designated SEQ ID:5260.

[86454] Another function of VGAM2549 is therefore inhibition of LOC92231 (Accession XM_043734). Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2550 (VGAM2550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86455] VGAM2550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2550 was detected is described hereinabove with reference to Figs. 1-8.

[86456] VGAM2550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces Cerevisiae Virus L-A. VGAM2550 host target gene, herein des-

ignated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86457] VGAM2550 gene encodes a VGAM2550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2550 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2550 precursor RNA is designated SEQ ID:2536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2536 is located at position 4405 relative to the genome of Saccharomyces Cerevisiae Virus L-A.

[86458] VGAM2550 precursor RNA folds onto itself, forming VGAM2550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86459] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2550 folded precursor RNA into VGAM2550

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2550 RNA is designated SEQ ID:5261, and is provided hereinbelow with reference to the sequence listing part.

[86460] VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2550 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86461] VGAM2550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2550 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86462] The complementary binding of VGAM2550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2550 host target RNA into VGAM2550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[86463] It is appreciated that VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2550 host target genes. The mRNA of each one of this plurality of VGAM2550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2550 RNA, herein designated VGAM RNA, and which when bound by VGAM2550 RNA causes inhibition of translation of respective one or more VGAM2550 host target proteins.

[86464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2550 gene, herein designated VGAM GENE, on one or more VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86465] It is yet further appreciated that a function of VGAM2550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of viral infection by Saccharomyces Cerevisiae Virus L-A. Specific functions, and accordingly utilities, of VGAM2550 correlate with, and may be deduced from, the identity of the host target genes which VGAM2550 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86466] Nucleotide sequences of the VGAM2550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2550 are further described hereinbelow with reference to Table 1.

[86467] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2550 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2550 gene, herein designated VGAM is inhibition of expression of VGAM2550 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2550 correlate with, and may be deduced from, the identity of the target genes which VGAM2550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86469] Cyclic Nucleotide Gated Channel Beta 3 (CNGB3, Accession NM_019098) is a VGAM2550 host target gene. CNGB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNGB3 BINDING SITE, designated SEQ ID:21176, to the nucleotide sequence of VGAM2550 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5261.

[86470] A function of VGAM2550 is therefore inhibition of Cyclic Nucleotide Gated Channel Beta 3 (CNGB3, Accession NM_019098). Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNGB3. FK506 Binding Protein 5 (FKBP5, Accession NM_004117) is another VGAM2550 host target gene. FKBP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP5 BINDING SITE, designated SEQ ID:10324, to the nucleotide sequence of VGAM2550 RNA, herein designated VGAM RNA, also designated SEQ ID:5261.

[86471] Another function of VGAM2550 is therefore inhibition of FK506 Binding Protein 5 (FKBP5, Accession NM_004117). Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP5. KIAA0939 (Accession XM_030524) is another VGAM2550 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31065, to the nucleotide sequence of VGAM2550 RNA, herein designated VGAM RNA, also designated SEQ ID:5261.

[86472] Another function of VGAM2550 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. LOC200010 (Accession XM_117174) is another VGAM2550 host target gene. LOC200010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200010 BINDING SITE, designated SEQ ID:43277, to the nucleotide sequence of VGAM2550 RNA, herein designated VGAM RNA, also designated SEQ ID:5261.

[86473] Another function of VGAM2550 is therefore inhibition of

LOC200010 (Accession XM_117174). Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200010. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2551 (VGAM2551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86474] VGAM2551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2551 was detected is described hereinabove with reference to Figs. 1-8.

[86475] VGAM2551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86476] VGAM2551 gene encodes a VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2551 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2551 precursor RNA is designated SEQ ID:2537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2537 is located at position 11536 relative to the genome of Rice Yellow Stunt Virus.

[86477] VGAM2551 precursor RNA folds onto itself, forming VGAM2551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2551 folded precursor RNA into VGAM2551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide se-

quence of VGAM2551 RNA is designated SEQ ID:5262, and is provided hereinbelow with reference to the sequence listing part.

[86479] VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2551 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86480] VGAM2551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2551 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86481] The complementary binding of VGAM2551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2551 host target RNA into VGAM2551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86482] It is appreciated that VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2551 host target genes. The mRNA of each one of this plurality of VGAM2551 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2551 RNA, herein designated VGAM RNA, and which when bound by VGAM2551 RNA causes inhibition of translation of respective one or more VGAM2551 host target proteins.

[86483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2551 gene, herein designated VGAM GENE, on one or more VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86484] It is yet further appreciated that a function of VGAM2551

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM2551 correlate with, and may be deduced from, the identity of the host target genes which VGAM2551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86485] Nucleotide sequences of the VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2551 are further described hereinbelow with reference to Table 1.

[86486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2551 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2551 gene, herein designated VGAM is inhibition of expression of VGAM2551 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2551 correlate with, and may be deduced from, the identity of the target genes which VGAM2551 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86488] Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862) is a VGAM2551 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16936, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86489] A function of VGAM2551 is therefore inhibition of Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utili-

ties of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345.Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B, Accession NM_032408) is another VGAM2551 host target gene. BAZ1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAZ1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ1B BINDING SITE, designated SEQ ID:26190, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86490] Another function of VGAM2551 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B, Accession NM_032408). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ1B. Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131) is another VGAM2551 host target gene.

C1orf6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:21327, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86491] Another function of VGAM2551 is therefore inhibition of Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131), a gene which may link ataxin-1 with the chaperone and ubiquitin/proteasome pathways . Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf6. The function of C1orf6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1286.Centromere Protein F, 350/400ka (mitosin) (CENPF, Accession NM_016343) is another VGAM2551 host target gene. CENPF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENPF, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPF BINDING SITE, designated SEQ ID:18470, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86492] Another function of VGAM2551 is therefore inhibition of Centromere Protein F, 350/400ka (mitosin) (CENPF, Accession NM_016343), a gene which is a protein of the nuclear matrix and regulates mitosis. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPF. The function of CENPF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1709.Chediak-Higashi Syndrome 1 (CHS1, Accession NM_000081) is another VGAM2551 host target gene. CHS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHS1 BINDING SITE, designated SEQ ID:5523,

to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86493] Another function of VGAM2551 is therefore inhibition of Chediak-Higashi Syndrome 1 (CHS1, Accession NM_000081), a gene which may sort endosomal resident proteins into late multivesicular endosome. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHS1. The function of CHS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Cartilage Linking Protein 1 (CRTL1, Accession NM_001884) is another VGAM2551 host target gene. CRTL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CRTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTL1 BINDING SITE, designated SEQ ID:7615, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86494] Another function of VGAM2551 is therefore inhibition of

Cartilage Linking Protein 1 (CRTL1, Accession NM_001884), a gene which stabilize the aggregates of proteoglycan monomers with hyaluronic acid. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTL1. The function of CRTL1 has been established by previous studies. Using a cDNA for the chicken protein, Osborne-Lawrence et al. (1990) isolated 2 overlapping clones that encode the entire human cartilage link protein. The deduced amino acid sequence is 354 residues long and shows a striking degree of similarity to porcine, rat, and chicken link protein sequences. By in situ hybridization, they mapped the gene to 5q13-q14.1. Dudhia et al. (1994) found that the CRTL1 gene comprises 5 exons and is spread over more than 60 kb. Primer extension and S1 nuclease protection analysis revealed transcription initiation to be 315 bases upstream from the translation initiation codon Cartilage link protein stabilizes aggregates of aggrecan and hyaluronan, giving cartilage its tensile strength and elasticity. Cartilage provides the template for endochondral ossification and is crucial for determining the length and width of the skeleton. During endochondral bone formation, hypertrophic chondrocytes die and

the cartilage is replaced with bone matrix. Watanabe and Yamada (1999) generated targeted mutations in cartilage link protein of mice (Crtl1). Homozygotes showed defects in cartilage development and delayed bone formation with short limbs and craniofacial anomalies. Most homozygous Crtl1 mutant mice died shortly after birth due to respiratory failure, but some survived and developed progressive dwarfism and lordosis of the cervical spine. They showed small epiphyses, slightly flared metaphyses of long bones, and flattened vertebrae, characteristic of spondyloepiphyseal dysplasias. The cartilage contained significantly reduced aggrecan depositions in the hypertrophic zone and decreased numbers of prehypertrophic and hypertrophic chondrocytes. Reduced Indian hedgehog (OMIM Ref. No. 600726) expression was observed in prehypertrophic chondrocytes, and apoptosis was inhibited in hypertrophic chondrocytes. The results indicated that cartilage link protein is important for the formation of proteoglycan aggregates and normal organization of hypertrophic chondrocytes, and suggested that cartilage matrix has a role in chondrocyte differentiation and maturation

[86495] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[86496] Osborne-Lawrence, S. L.; Sinclair, A. K.; Hicks, R. C.; Lacey, S. W.; Eddy, R. L., Jr.; Byers, M. G.; Shows, T. B.; Duby, A. D. : Complete amino acid sequence of human cartilage link protein (CRTL1) deduced from cDNA clones and chromosomal assignment of the gene. Genomics 8: 562-567, 1990. ; and

[86497] Watanabe, H.; Yamada, Y. : Mice lacking link protein develop dwarfism and craniofacial abnormalities. Nature Genet. 21: 225-229, 1999.

[86498] Further studies establishing the function and utilities of CRTL1 are found in John Hopkins OMIM database record ID 115435, and in sited publications numbered 3 and 12584-12586 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Death-associated Protein Kinase 1 (DAPK1, Accession NM_004938) is another VGAM2551 host target gene. DAPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK1 BINDING SITE, designated SEQ

ID:11386, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86499] Another function of VGAM2551 is therefore inhibition of Death-associated Protein Kinase 1 (DAPK1, Accession NM_004938). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK1. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM2551 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11954, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86500] Another function of VGAM2551 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly,

utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.Neuronal Pentraxin I (NPTX1, Accession NM_002522) is another VGAM2551 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8356, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86501] Another function of VGAM2551 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.Perilipin (PLIN, Accession NM_002666) is another VGAM2551 host target gene. PLIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLIN BINDING SITE, designated SEQ ID:8535, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86502] Another function of VGAM2551 is therefore inhibition of Perilipin (PLIN, Accession NM_002666). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLIN. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM2551 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:8304, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86503] Another function of VGAM2551 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM838.Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM_040709) is another VGAM2551 host target gene. PTGFRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33361, to the nucleotide sequence of VGAM2551 RNA,

herein designated VGAM RNA, also designated SEQ ID:5262.

[86504] Another function of VGAM2551 is therefore inhibition of Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM_040709), a gene which inhibits the binding of prostaglandin f2-alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Paxillin (PXN, Accession NM_002859) is another VGAM2551 host target gene. PXN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:8759, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86505] Another function of VGAM2551 is therefore inhibition of Paxillin (PXN, Accession NM_002859), a gene which may

be involved in p53-dependent apoptosis. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXN. The function of PXN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.SMURF1 (Accession XM_166483) is another VGAM2551 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44409, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86506] Another function of VGAM2551 is therefore inhibition of SMURF1 (Accession XM_166483). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149) is another VGAM2551 host target gene. STAC BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by STAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAC BINDING SITE, designated SEQ ID:9119, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86507] Another function of VGAM2551 is therefore inhibition of Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149), a gene which is probably involved in a neuron-specific signal transduction. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAC. The function of STAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331.TEM8 (Accession NM_032208) is another VGAM2551 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:25917, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86508] Another function of VGAM2551 is therefore inhibition of TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The function of TEM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1489.Tenascin C (hexabrachion) (TNC, Accession NM_002160) is another VGAM2551 host target gene. TNC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNC BINDING SITE, designated SEQ ID:7934, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86509] Another function of VGAM2551 is therefore inhibition of

Tenascin C (hexabrachion) (TNC, Accession NM_002160), a gene which has epidermal growth factor-like repeats. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNC. The function of TNC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM808.Tropomyosin 4 (TPM4, Accession NM_003290) is another VGAM2551 host target gene. TPM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPM4 BINDING SITE, designated SEQ ID:9300, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86510] Another function of VGAM2551 is therefore inhibition of Tropomyosin 4 (TPM4, Accession NM_003290), a gene which plays a central role, in association with the troponin complex, in the calcium dependent regulation of vertebrate striated muscle contraction. Accordingly, utilities of

VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPM4. The function of TPM4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM744.X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399) is another VGAM2551 host target gene. XPNPEP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPNPEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPNPEP2 BINDING SITE, designated SEQ ID:9433, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86511] Another function of VGAM2551 is therefore inhibition of X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399), a gene which is a membrane-associated X-prolyl metallopeptidase . Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPNPEP2. The function of XPNPEP2

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2108.BRAG (Accession NM_014863) is another VGAM2551 host target gene. BRAG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRAG BINDING SITE, designated SEQ ID:16940, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86512] Another function of VGAM2551 is therefore inhibition of BRAG (Accession NM_014863). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRAG. Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398) is another VGAM2551 host target gene. C20orf98 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of C20orf98 BINDING SITE, designated SEQ ID:35416, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86513] Another function of VGAM2551 is therefore inhibition of Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98. ENDO180 (Accession NM_006039) is another VGAM2551 host target gene. ENDO180 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENDO180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDO180 BINDING SITE, designated SEQ ID:12674, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86514] Another function of VGAM2551 is therefore inhibition of ENDO180 (Accession NM_006039). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ENDO180. F-box Only Protein 4 (FBXO4, Accession NM_033484) is another VGAM2551 host target gene. FBXO4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO4 BINDING SITE, designated SEQ ID:27262, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86515] Another function of VGAM2551 is therefore inhibition of F-box Only Protein 4 (FBXO4, Accession NM_033484). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO4. FLJ10512 (Accession NM_018121) is another VGAM2551 host target gene. FLJ10512 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10512 BINDING SITE, designated SEQ ID:19902, to the

nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86516] Another function of VGAM2551 is therefore inhibition of FLJ10512 (Accession NM_018121). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10512. FLJ11457 (Accession NM_024753) is another VGAM2551 host target gene. FLJ11457 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11457 BINDING SITE, designated SEQ ID:24094, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86517] Another function of VGAM2551 is therefore inhibition of FLJ11457 (Accession NM_024753). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11457. FLJ14146 (Accession NM_024709) is another VGAM2551 host target gene. FLJ14146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24029, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86518] Another function of VGAM2551 is therefore inhibition of FLJ14146 (Accession NM_024709). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. FLJ20034 (Accession NM_017630) is another VGAM2551 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19128, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86519] Another function of VGAM2551 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of

VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ20094 (Accession NM_017665) is another VGAM2551 host target gene. FLJ20094 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20094 BINDING SITE, designated SEQ ID:19208, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86520] Another function of VGAM2551 is therefore inhibition of FLJ20094 (Accession NM_017665). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20094. GBTS1 (Accession NM_145173) is another VGAM2551 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE,

designated SEQ ID:29725, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86521] Another function of VGAM2551 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. HCC-4 (Accession NM_138611) is another VGAM2551 host target gene. HCC-4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCC-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCC-4 BINDING SITE, designated SEQ ID:28896, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86522] Another function of VGAM2551 is therefore inhibition of HCC-4 (Accession NM_138611). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCC-4. HRIHFB2072 (Accession NM_032547) is another VGAM2551 host target gene. HRIHFB2072 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRIHFB2072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRI-HFB2072 BINDING SITE, designated SEQ ID:26271, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86523] Another function of VGAM2551 is therefore inhibition of HRIHFB2072 (Accession NM_032547). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2072. KIAA0255 (Accession NM_014742) is another VGAM2551 host target gene. KIAA0255 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0255 BINDING SITE, designated SEQ ID:16413, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86524] Another function of VGAM2551 is therefore inhibition of

KIAA0255 (Accession NM_014742). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. KIAA1198 (Accession XM_032674) is another VGAM2551 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31702, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86525] Another function of VGAM2551 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1473 (Accession XM_047550) is another VGAM2551 host target gene. KIAA1473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1473 BINDING SITE, designated SEQ ID:34995, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86526] Another function of VGAM2551 is therefore inhibition of KIAA1473 (Accession XM_047550). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1473. KIAA1538 (Accession XM_049474) is another VGAM2551 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35431, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86527] Another function of VGAM2551 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. MGC15906 (Accession NM_032885) is another

VGAM2551 host target gene. MGC15906 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC15906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15906 BINDING SITE, designated SEQ ID:26707, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86528] Another function of VGAM2551 is therefore inhibition of MGC15906 (Accession NM_032885). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15906. MGC22014 (Accession XM_035307) is another VGAM2551 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32218, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86529] Another function of VGAM2551 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. MGC5466 (Accession XM_054436) is another VGAM2551 host target gene. MGC5466 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5466 BINDING SITE, designated SEQ ID:36159, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86530] Another function of VGAM2551 is therefore inhibition of MGC5466 (Accession XM_054436). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5466. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651) is another VGAM2551 host target gene. PELI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21815, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86531] Another function of VGAM2551 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. RAB3GAP (Accession XM_040048) is another VGAM2551 host target gene. RAB3GAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB3GAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3GAP BINDING SITE, designated SEQ ID:33245, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86532] Another function of VGAM2551 is therefore inhibition of RAB3GAP (Accession XM_040048). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RAB3GAP. SEC31B-1 (Accession NM_015490) is another VGAM2551 host target gene. SEC31B-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC31B-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC31B-1 BINDING SITE, designated SEQ ID:17760, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86533] Another function of VGAM2551 is therefore inhibition of SEC31B-1 (Accession NM_015490). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC31B-1. Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018) is another VGAM2551 host target gene. SLC38A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC38A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A4 BINDING SITE, designated SEQ

ID:19756, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86534] Another function of VGAM2551 is therefore inhibition of Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A4. T-box 4 (TBX4, Accession NM_018488) is another VGAM2551 host target gene. TBX4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX4 BINDING SITE, designated SEQ ID:20544, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86535] Another function of VGAM2551 is therefore inhibition of T-box 4 (TBX4, Accession NM_018488). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX4. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM2551 host target gene.

TOB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45762, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86536] Another function of VGAM2551 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. Zinc Finger Protein 221 (ZNF221, Accession NM_013359) is another VGAM2551 host target gene. ZNF221 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF221 BINDING SITE, designated SEQ ID:15008, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86537] Another function of VGAM2551 is therefore inhibition of Zinc Finger Protein 221 (ZNF221, Accession NM_013359). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF221. LOC144395 (Accession XM_084850) is another VGAM2551 host target gene. LOC144395 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144395 BINDING SITE, designated SEQ ID:37732, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86538] Another function of VGAM2551 is therefore inhibition of LOC144395 (Accession XM_084850). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144395. LOC145719 (Accession XM_096848) is another VGAM2551 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145719, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40577, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86539] Another function of VGAM2551 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM2551 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40566, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86540] Another function of VGAM2551 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145720. LOC146802 (Accession XM_085595) is another VGAM2551 host target gene. LOC146802 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146802 BINDING SITE, designated SEQ ID:38245, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86541] Another function of VGAM2551 is therefore inhibition of LOC146802 (Accession XM_085595). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146802. LOC148198 (Accession XM_047554) is another VGAM2551 host target gene. LOC148198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148198 BINDING SITE, designated SEQ ID:34999, to

the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86542] Another function of VGAM2551 is therefore inhibition of LOC148198 (Accession XM_047554). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148198. LOC150203 (Accession XM_018294) is another VGAM2551 host target gene. LOC150203 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150203 BINDING SITE, designated SEQ ID:30349, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86543] Another function of VGAM2551 is therefore inhibition of LOC150203 (Accession XM_018294). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150203. LOC150350 (Accession XM_086861) is another VGAM2551 host target gene. LOC150350 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC150350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150350 BINDING SITE, designated SEQ ID:38929, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86544] Another function of VGAM2551 is therefore inhibition of LOC150350 (Accession XM_086861). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150350. LOC151647 (Accession XM_087261) is another VGAM2551 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39156, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86545] Another function of VGAM2551 is therefore inhibition of LOC151647 (Accession XM_087261). Accordingly, utilities

of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC197114 (Accession XM_116987) is another VGAM2551 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43189, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86546] Another function of VGAM2551 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC197117 (Accession XM_116989) is another VGAM2551 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC197117 BINDING SITE, designated SEQ ID:43196, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86547] Another function of VGAM2551 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. LOC221178 (Accession XM_167936) is another VGAM2551 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44925, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86548] Another function of VGAM2551 is therefore inhibition of LOC221178 (Accession XM_167936). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC221398 (Accession XM_165762) is another VGAM2551 host target gene. LOC221398 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221398 BINDING SITE, designated SEQ ID:43749, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86549] Another function of VGAM2551 is therefore inhibition of LOC221398 (Accession XM_165762). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221398. LOC221656 (Accession XM_166418) is another VGAM2551 host target gene. LOC221656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221656 BINDING SITE, designated SEQ ID:44292, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86550] Another function of VGAM2551 is therefore inhibition of

LOC221656 (Accession XM_166418). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221656. LOC254018 (Accession XM_173066) is another VGAM2551 host target gene. LOC254018 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254018 BINDING SITE, designated SEQ ID:46317, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86551] Another function of VGAM2551 is therefore inhibition of LOC254018 (Accession XM_173066). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254018. LOC91012 (Accession XM_035503) is another VGAM2551 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32285, to the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, also designated SEQ ID:5262.

[86552] Another function of VGAM2551 is therefore inhibition of LOC91012 (Accession XM_035503). Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2552 (VGAM2552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86553] VGAM2552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2552 was detected is described hereinabove with reference to Figs. 1-8.

[86554] VGAM2552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Ragged Stunt Virus. VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[86555] VGAM2552 gene encodes a VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2552 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2552 precursor RNA is designated SEQ ID:2538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2538 is located at position 3478 relative to the genome of Rice Ragged Stunt Virus.

[86556] VGAM2552 precursor RNA folds onto itself, forming VGAM2552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2552 folded precursor RNA into VGAM2552 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2552 RNA is designated SEQ ID:5263, and is provided hereinbelow with reference to the sequence listing part.

[86558] VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2552 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86559] VGAM2552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2552 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86560] The complementary binding of VGAM2552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2552 host target RNA into VGAM2552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86561] It is appreciated that VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2552 host target genes. The mRNA of each one of this plurality of VGAM2552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2552 RNA, herein designated VGAM RNA, and which when bound by VGAM2552 RNA causes inhibition of translation of respective one or more VGAM2552 host target proteins.

[86562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2552 gene, herein designated VGAM GENE, on one or more VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86563] It is yet further appreciated that a function of VGAM2552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2552 include diagnosis, prevention and treatment of viral infection by Rice Ragged Stunt Virus. Specific functions, and accordingly utilities, of VGAM2552 correlate with, and may be deduced from, the identity of the host target genes which VGAM2552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86564] Nucleotide sequences of the VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2552 are further described hereinbelow with reference to Table 1.

[86565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2552 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2552 gene, herein designated VGAM is inhibition of expression of VGAM2552 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2552 correlate with, and may be deduced from, the identity of the target genes which VGAM2552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86567] Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is a VGAM2552 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21909, to the nucleotide sequence of VGAM2552 RNA, herein designated VGAM RNA, also designated SEQ ID:5263.

[86568] A function of VGAM2552 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM2552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2553 (VGAM2553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86569] VGAM2553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2553 was detected is described hereinabove with reference to Figs. 1-8.

[86570] VGAM2553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Ragged Stunt Virus. VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86571] VGAM2553 gene encodes a VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2553 precursor RNA is designated SEQ ID:2539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2539 is located at position 271 relative to the genome of Rice Ragged Stunt Virus.

[86572] VGAM2553 precursor RNA folds onto itself, forming VGAM2553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86573] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2553 folded precursor RNA into VGAM2553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2553 RNA is designated SEQ ID:5264, and is provided hereinbelow with reference to the sequence listing part.

[86574] VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2553 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86575] VGAM2553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2553 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86576] The complementary binding of VGAM2553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2553 host target RNA into VGAM2553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86577] It is appreciated that VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2553 host target genes. The mRNA of each one of this plurality of VGAM2553 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2553 RNA, herein designated VGAM RNA, and which when bound by VGAM2553 RNA causes inhibition of translation of respective one or more VGAM2553 host target proteins.

[86578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2553 gene, herein designated VGAM GENE, on one or more VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86579] It is yet further appreciated that a function of VGAM2553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of viral infection by Rice Ragged Stunt Virus. Specific functions, and accordingly utilities, of VGAM2553 correlate with, and may be deduced from, the identity of the host target genes which VGAM2553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86580] Nucleotide sequences of the VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2553 are further described hereinbelow with reference to Table 1.

[86581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2553 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2553 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[86582] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2553 gene, herein designated VGAM is inhibition of expression of VGAM2553 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2553 correlate with, and may be deduced from, the identity of the target genes which VGAM2553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86583] Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782) is a VGAM2553 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6426, to the nucleotide sequence of VGAM2553 RNA, herein designated VGAM RNA, also designated SEQ ID:5264.

[86584] A function of VGAM2553 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782), a gene

which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24. The function of CYP24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1204.C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM_031911) is another VGAM2553 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25665, to the nucleotide sequence of VGAM2553 RNA, herein designated VGAM RNA, also designated SEQ ID:5264.

[86585] Another function of VGAM2553 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM_031911). Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

C1QTNF7. KIAA1274 (Accession XM_166125) is another VGAM2553 host target gene. KIAA1274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43910, to the nucleotide sequence of VGAM2553 RNA, herein designated VGAM RNA, also designated SEQ ID:5264.

[86586] Another function of VGAM2553 is therefore inhibition of KIAA1274 (Accession XM_166125). Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918) is another VGAM2553 host target gene. RERG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RERG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERG BINDING SITE, designated SEQ ID:26739, to the nucleotide sequence of

VGAM2553 RNA, herein designated VGAM RNA, also designated SEQ ID:5264.

[86587] Another function of VGAM2553 is therefore inhibition of RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918). Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERG. LOC256940 (Accession XM_172879) is another VGAM2553 host target gene. LOC256940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256940 BINDING SITE, designated SEQ ID:46155, to the nucleotide sequence of VGAM2553 RNA, herein designated VGAM RNA, also designated SEQ ID:5264.

[86588] Another function of VGAM2553 is therefore inhibition of LOC256940 (Accession XM_172879). Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256940. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2554 (VGAM2554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86589] VGAM2554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2554 was detected is described hereinabove with reference to Figs. 1-8.

[86590] VGAM2554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia Stali Intestine Virus. VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86591] VGAM2554 gene encodes a VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2554 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2554 precursor RNA is designated SEQ ID:2540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2540 is located at position 685 relative to the

genome of Plautia Stali Intestine Virus.

[86592] VGAM2554 precursor RNA folds onto itself, forming VGAM2554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86593] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2554 folded precursor RNA into VGAM2554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2554 RNA is designated SEQ ID:5265, and is provided hereinbelow with reference to the sequence listing part.

[86594] VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2554 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86595] VGAM2554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2554 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86596] The complementary binding of VGAM2554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2554 host target RNA into VGAM2554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86597] It is appreciated that VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2554 host target genes. The mRNA of each one of this plurality of VGAM2554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2554 RNA, herein designated VGAM RNA, and which when bound by VGAM2554 RNA causes inhibition of translation of respective one or more VGAM2554 host target proteins.

[86598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2554 gene, herein designated VGAM GENE, on one or more VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86599] It is yet further appreciated that a function of VGAM2554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of viral infection by Plautia Stali Intestine Virus. Specific functions, and accordingly utilities, of VGAM2554

correlate with, and may be deduced from, the identity of the host target genes which VGAM2554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86600] Nucleotide sequences of the VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2554 are further described hereinbelow with reference to Table 1.

[86601] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2554 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86602] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2554 gene, herein designated VGAM is inhibition of expression of VGAM2554 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2554 correlate with, and may be deduced

from, the identity of the target genes which VGAM2554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86603] ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020326) is a VGAM2554 host target gene. ABCD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE, designated SEQ ID:21592, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86604] A function of VGAM2554 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020326), a gene which Putative peroxisomal ATP binding cassette transporter. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4. The function of ABCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1924.Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083) is another VGAM2554 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18162, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86605] Another function of VGAM2554 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533.Fc Fragment of IgG, Low Affinity IIa, Receptor For (CD32) (FCGR2A, Accession XM_086483) is another VGAM2554 host target gene. FCGR2A BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCGR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCGR2A BINDING SITE, designated SEQ ID:38697, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86606] Another function of VGAM2554 is therefore inhibition of Fc Fragment of IgG, Low Affinity IIa, Receptor For (CD32) (FCGR2A, Accession XM_086483), a gene which binds IgG immune complexes; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCGR2A. The function of FCGR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745) is another VGAM2554 host target gene. MAPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK1 BINDING SITE, designated SEQ ID:8614, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86607] Another function of VGAM2554 is therefore inhibition of Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745), a gene which phosphorylates microtubule-associated protein-2 (map2). myelin basic protein (mbp), and elk-1; may promote entry in the cell cycle. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK1. The function of MAPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915) is another VGAM2554 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13792, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86608] Another function of VGAM2554 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. DKFZP434C1715 (Accession XM_098421) is another VGAM2554 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41673, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86609] Another function of VGAM2554 is therefore inhibition of DKFZP434C1715 (Accession XM_098421). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434C1715. KIAA1416 (Accession XM_098762) is another VGAM2554 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41807, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86610] Another function of VGAM2554 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. MGC9912 (Accession NM_080664) is another VGAM2554 host target gene. MGC9912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC9912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9912 BINDING SITE, designated SEQ ID:27952, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM

RNA, also designated SEQ ID:5265.

[86611] Another function of VGAM2554 is therefore inhibition of MGC9912 (Accession NM_080664). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9912. LOC154222 (Accession XM_098497) is another VGAM2554 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41689, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86612] Another function of VGAM2554 is therefore inhibition of LOC154222 (Accession XM_098497). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222. LOC222060 (Accession XM_168427) is another VGAM2554 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222060, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45156, to the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, also designated SEQ ID:5265.

[86613] Another function of VGAM2554 is therefore inhibition of LOC222060 (Accession XM_168427). Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2555 (VGAM2555) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86614] VGAM2555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2555 was detected is described hereinabove with reference to Figs. 1-8.

[86615] VGAM2555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia Stali Intestine

Virus. VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86616] VGAM2555 gene encodes a VGAM2555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2555 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2555 precursor RNA is designated SEQ ID:2541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2541 is located at position 3272 relative to the genome of Plautia Stali Intestine Virus.

[86617] VGAM2555 precursor RNA folds onto itself, forming VGAM2555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86618] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2555 folded precursor RNA into VGAM2555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2555 RNA is designated SEQ ID:5266, and is provided hereinbelow with reference to the sequence listing part.

[86619] VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2555 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86620] VGAM2555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2555 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86621] The complementary binding of VGAM2555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2555 host target RNA into VGAM2555 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86622] It is appreciated that VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2555 host target genes. The mRNA of each one of this plurality of VGAM2555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2555 RNA, herein designated VGAM RNA, and which when bound by VGAM2555 RNA causes inhibition of translation of respective one or more VGAM2555 host target proteins.

[86623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2555 gene, herein designated VGAM GENE, on one or more VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86624] It is yet further appreciated that a function of VGAM2555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of viral infection by Plautia Stali Intestine Virus. Specific functions, and accordingly utilities, of VGAM2555 correlate with, and may be deduced from, the identity of the host target genes which VGAM2555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86625] Nucleotide sequences of the VGAM2555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2555 are further described hereinbelow with reference to Table 1.

[86626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2555 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86627] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2555 gene, herein designated VGAM is inhibition of expression of VGAM2555 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2555 correlate with, and may be deduced from, the identity of the target genes which VGAM2555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86628] GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978) is a VGAM2555 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:33659, to the

nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86629] A function of VGAM2555 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. HCS (Accession NM_018947) is another VGAM2555 host target gene. HCS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCS BINDING SITE, designated SEQ ID:21014, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86630] Another function of VGAM2555 is therefore inhibition of HCS (Accession NM_018947). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCS. WD Repeat Domain 4 (WDR4, Accession NM_033662) is another VGAM2555 host target gene. WDR4 BINDING SITE1 and WDR4 BINDING SITE2 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by WDR4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR4 BINDING SITE1 and WDR4 BINDING SITE2, designated SEQ ID:27391 and SEQ ID:20744 respectively, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86631] Another function of VGAM2555 is therefore inhibition of WD Repeat Domain 4 (WDR4, Accession NM_033662). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR4. KIAA1755 (Accession XM_028810) is another VGAM2555 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30748, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86632] Another function of VGAM2555 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM2555 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18735, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86633] Another function of VGAM2555 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084) is another VGAM2555 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17475, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86634] Another function of VGAM2555 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession

NM_015084). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27. RAP140 (Accession NM_015224) is another VGAM2555 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17554, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86635] Another function of VGAM2555 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. LOC152373 (Accession XM_087449) is another VGAM2555 host target gene. LOC152373 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC152373 BINDING SITE, designated SEQ ID:39270, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86636] Another function of VGAM2555 is therefore inhibition of LOC152373 (Accession XM_087449). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152373. LOC90155 (Accession XM_029487) is another VGAM2555 host target gene. LOC90155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90155 BINDING SITE, designated SEQ ID:30899, to the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, also designated SEQ ID:5266.

[86637] Another function of VGAM2555 is therefore inhibition of LOC90155 (Accession XM_029487). Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90155. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2556 (VGAM2556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86638] VGAM2556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2556 was detected is described hereinabove with reference to Figs. 1-8.

[86639] VGAM2556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia Stali Intestine Virus. VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86640] VGAM2556 gene encodes a VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2556 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2556 precursor RNA is designated SEQ ID:2542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2542 is located at position 4204 relative to the genome of Plautia Stali Intestine Virus.

[86641] VGAM2556 precursor RNA folds onto itself, forming VGAM2556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86642] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2556 folded precursor RNA into VGAM2556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2556 RNA is designated SEQ ID:5267, and is provided hereinbelow with reference to the sequence listing part.

[86643] VGAM2556 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2556 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86644] VGAM2556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2556 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2556 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86645] The complementary binding of VGAM2556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2556 host target RNA into VGAM2556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86646] It is appreciated that VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2556 host target genes. The mRNA of each one of this plurality of VGAM2556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2556 RNA, herein designated VGAM RNA, and which when bound by VGAM2556 RNA causes inhibition of translation of respective one or more

VGAM2556 host target proteins.

[86647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2556 gene, herein designated VGAM GENE, on one or more VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86648] It is yet further appreciated that a function of VGAM2556 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of viral infection by Plautia Stali Intestine Virus.

Specific functions, and accordingly utilities, of VGAM2556 correlate with, and may be deduced from, the identity of the host target genes which VGAM2556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86649] Nucleotide sequences of the VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2556 are further described hereinbelow with reference to Table 1.

[86650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2556 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86651] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2556 gene, herein designated VGAM is inhibition of expression of VGAM2556 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2556 correlate with, and may be deduced from, the identity of the target genes which VGAM2556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86652] Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is a VGAM2556 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7330, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86653] A function of VGAM2556 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM368.Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is another VGAM2556 host target gene. F8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5612, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86654] Another function of VGAM2556 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. FLJ10697 (Accession NM_018181) is another VGAM2556 host target gene. FLJ10697 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10697 BINDING SITE, designated SEQ ID:20015, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86655] Another function of VGAM2556 is therefore inhibition of FLJ10697 (Accession NM_018181). Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10697. LOC114971 (Accession XM_054936) is another VGAM2556 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36205, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86656] Another function of VGAM2556 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. LOC158158 (Accession XM_088494) is an-

other VGAM2556 host target gene. LOC158158 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158158 BINDING SITE, designated SEQ ID:39731, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86657] Another function of VGAM2556 is therefore inhibition of LOC158158 (Accession XM_088494). Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158158. LOC257319 (Accession XM_171049) is another VGAM2556 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45833, to the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, also designated SEQ ID:5267.

[86658] Another function of VGAM2556 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2557 (VGAM2557) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86659] VGAM2557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2557 was detected is described hereinabove with reference to Figs. 1-8.

[86660] VGAM2557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86661] VGAM2557 gene encodes a VGAM2557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2557 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2557 precursor RNA is designated SEQ ID:2543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2543 is located at position 8347 relative to the genome of Himetobi P Virus.

[86662] VGAM2557 precursor RNA folds onto itself, forming VGAM2557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86663] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2557 folded precursor RNA into VGAM2557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2557 RNA is designated SEQ ID:5268, and is provided hereinbelow with reference to the sequence listing part.

[86664] VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2557 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86665] VGAM2557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2557 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2557 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86666] The complementary binding of VGAM2557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2557 host target RNA into VGAM2557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86667] It is appreciated that VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2557 host target genes. The mRNA of each one of this plurality of VGAM2557 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2557 RNA, herein designated VGAM RNA, and which when bound by VGAM2557 RNA causes inhibition of translation of respective one or more VGAM2557 host target proteins.

[86668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2557 gene, herein designated VGAM GENE, on one or more VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86669] It is yet further appreciated that a function of VGAM2557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2557 correlate with, and may be deduced from, the identity of the host target genes which VGAM2557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86670] Nucleotide sequences of the VGAM2557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2557 are further described hereinbelow with reference to Table 1.

[86671] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2557 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2557 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[86672] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2557 gene, herein designated VGAM is inhibition of expression of VGAM2557 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2557 correlate with, and may be deduced from, the identity of the target genes which VGAM2557 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86673] Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281) is a VGAM2557 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14611, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86674] A function of VGAM2557 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281), a gene which

is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM449.RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739) is another VGAM2557 host target gene. RASGRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASGRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP1 BINDING SITE, designated SEQ ID:12301, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86675] Another function of VGAM2557 is therefore inhibition of RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with RASGRP1. FLJ14166 (Accession NM_024565) is another VGAM2557 host target gene. FLJ14166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:23793, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86676] Another function of VGAM2557 is therefore inhibition of FLJ14166 (Accession NM_024565). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14166. FLJ33069 (Accession NM_144649) is another VGAM2557 host target gene. FLJ33069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ33069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ33069 BINDING SITE, designated SEQ ID:29473, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM

RNA, also designated SEQ ID:5268.

[86677] Another function of VGAM2557 is therefore inhibition of FLJ33069 (Accession NM_144649). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33069. KIAA0152 (Accession NM_014730) is another VGAM2557 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16331, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86678] Another function of VGAM2557 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. LOC148195 (Accession XM_097419) is another VGAM2557 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148195, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40879, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86679] Another function of VGAM2557 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC148562 (Accession XM_086240) is another VGAM2557 host target gene. LOC148562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148562 BINDING SITE, designated SEQ ID:38565, to the nucleotide sequence of VGAM2557 RNA, herein designated VGAM RNA, also designated SEQ ID:5268.

[86680] Another function of VGAM2557 is therefore inhibition of LOC148562 (Accession XM_086240). Accordingly, utilities of VGAM2557 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148562. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2558 (VGAM2558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86681] VGAM2558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2558 was detected is described hereinabove with reference to Figs. 1-8.

[86682] VGAM2558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86683] VGAM2558 gene encodes a VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2558 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2558 precursor RNA is desig-

nated SEQ ID:2544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2544 is located at position 7354 relative to the genome of Himetobi P Virus.

[86684] VGAM2558 precursor RNA folds onto itself, forming VGAM2558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86685] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2558 folded precursor RNA into VGAM2558 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2558 RNA is designated SEQ ID:5269, and is provided hereinbelow with reference to the sequence

listing part.

[86686] VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2558 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86687] VGAM2558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2558 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2558 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86688] The complementary binding of VGAM2558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2558 host target RNA into VGAM2558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86689] It is appreciated that VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2558 host target genes. The mRNA of each one of this plurality of VGAM2558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2558 RNA, herein designated VGAM

RNA, and which when bound by VGAM2558 RNA causes inhibition of translation of respective one or more VGAM2558 host target proteins.

[86690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2558 gene, herein designated VGAM GENE, on one or more VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86691] It is yet further appreciated that a function of VGAM2558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2558 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2558 correlate with, and may be deduced from, the identity of the host target genes which VGAM2558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86692] Nucleotide sequences of the VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2558 are further described hereinbelow with reference to Table 1.

[86693] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2558 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86694] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2558 gene, herein designated VGAM is

inhibition of expression of VGAM2558 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2558 correlate with, and may be deduced from, the identity of the target genes which VGAM2558 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86695] DNAM-1 (Accession NM_006566) is a VGAM2558 host target gene. DNAM-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:13338, to the nucleotide sequence of VGAM2558 RNA, herein designated VGAM RNA, also designated SEQ ID:5269.

[86696] A function of VGAM2558 is therefore inhibition of DNAM-1 (Accession NM_006566). Accordingly, utilities of VGAM2558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2559 (VGAM2559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86697] VGAM2559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2559 was detected is described hereinabove with reference to Figs. 1-8.

[86698] VGAM2559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86699] VGAM2559 gene encodes a VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2559 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2559 precursor RNA is designated SEQ ID:2545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2545 is located at position 8220 relative to the genome of Himetobi P Virus.

[86700] VGAM2559 precursor RNA folds onto itself, forming VGAM2559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86701] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2559 folded precursor RNA into VGAM2559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2559 RNA is designated SEQ ID:5270, and is provided hereinbelow with reference to the sequence listing part.

[86702] VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2559 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2559 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86703] VGAM2559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2559 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86704] The complementary binding of VGAM2559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2559 host target RNA into VGAM2559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86705] It is appreciated that VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2559 host target genes. The mRNA of each one of this plurality of VGAM2559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2559 RNA, herein designated VGAM RNA, and which when bound by VGAM2559 RNA causes inhibition of translation of respective one or more VGAM2559 host target proteins.

[86706] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2559 gene, herein designated VGAM GENE, on one or more VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86707] It is yet further appreciated that a function of VGAM2559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2559 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86708] Nucleotide sequences of the VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2559 are further described hereinbelow with reference to Table 1.

[86709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2559 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2559 gene, herein designated VGAM is inhibition of expression of VGAM2559 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2559 correlate with, and may be deduced from, the identity of the target genes which VGAM2559

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86711] Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569) is a VGAM2559 host target gene. DMWD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMWD BINDING SITE, designated SEQ ID:30529, to the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, also designated SEQ ID:5270.

[86712] A function of VGAM2559 is therefore inhibition of Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMWD. KIAA0450 (Accession NM_014638) is another VGAM2559 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16029, to the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, also designated SEQ ID:5270.

[86713] Another function of VGAM2559 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0594 (Accession XM_036117) is another VGAM2559 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32386, to the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, also designated SEQ ID:5270.

[86714] Another function of VGAM2559 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0594. KIAA1940 (Accession XM_086981) is another VGAM2559 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39005, to the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, also designated SEQ ID:5270.

[86715] Another function of VGAM2559 is therefore inhibition of KIAA1940 (Accession XM_086981). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. MGC11257 (Accession NM_032350) is another VGAM2559 host target gene. MGC11257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11257 BINDING SITE, designated SEQ ID:26139, to the nucleotide sequence of VGAM2559 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5270.

[86716] Another function of VGAM2559 is therefore inhibition of MGC11257 (Accession NM_032350). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11257. LOC154739 (Accession XM_098602) is another VGAM2559 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41717, to the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, also designated SEQ ID:5270.

[86717] Another function of VGAM2559 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2560 (VGAM2560) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86718] VGAM2560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2560 was detected is described hereinabove with reference to Figs. 1-8.

[86719] VGAM2560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86720] VGAM2560 gene encodes a VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2560 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2560 precursor RNA is designated SEQ ID:2546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2546 is located at position 8011 relative to the genome of Himetobi P Virus.

[86721] VGAM2560 precursor RNA folds onto itself, forming

VGAM2560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86722] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2560 folded precursor RNA into VGAM2560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2560 RNA is designated SEQ ID:5271, and is provided hereinbelow with reference to the sequence listing part.

[86723] VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2560 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86724] VGAM2560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2560 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86725] The complementary binding of VGAM2560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2560 host target RNA into VGAM2560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86726] It is appreciated that VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2560 host target genes. The mRNA of each one of this plurality of VGAM2560 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2560 RNA, herein designated VGAM RNA, and which when bound by VGAM2560 RNA causes inhibition of translation of respective one or more VGAM2560 host target proteins.

[86727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2560 gene, herein designated VGAM GENE, on one or more VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86728] It is yet further appreciated that a function of VGAM2560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2560 correlate with, and may be deduced from, the identity of the host target genes which VGAM2560 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[86729] Nucleotide sequences of the VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2560 are further described hereinbelow with reference to Table 1.

[86730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2560 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86731] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2560 gene, herein designated VGAM is inhibition of expression of VGAM2560 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2560 correlate with, and may be deduced from, the identity of the target genes which VGAM2560 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[86732] Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586) is a VGAM2560 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15949, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86733] A function of VGAM2560 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586). Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Interleukin 1, Beta (IL1B, Accession NM_000576) is another VGAM2560 host target gene. IL1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1B BINDING SITE, desig-

nated SEQ ID:6175, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86734] Another function of VGAM2560 is therefore inhibition of Interleukin 1, Beta (IL1B, Accession NM_000576), a gene which stimulates thymocyte proliferation. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1B. The function of IL1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2007.Mucin 4, Tracheobronchial (MUC4, Accession NM_138298) is another VGAM2560 host target gene. MUC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MUC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC4 BINDING SITE, designated SEQ ID:28711, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86735] Another function of VGAM2560 is therefore inhibition of

Mucin 4, Tracheobronchial (MUC4, Accession NM_138298), a gene which may act as a ligand for ErbB2 mediated cell signalling. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC4. The function of MUC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1290.Peripheral Myelin Protein 2 (PMP2, Accession NM_002677) is another VGAM2560 host target gene. PMP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMP2 BINDING SITE, designated SEQ ID:8545, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86736] Another function of VGAM2560 is therefore inhibition of Peripheral Myelin Protein 2 (PMP2, Accession NM_002677), a gene which is a lipid transport protein in schwann cells. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PMP2. The function of PMP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.SWAP70 (Accession XM_049197) is another VGAM2560 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35350, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86737] Another function of VGAM2560 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1090.Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM_043609) is another VGAM2560 host target gene. SULT4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SULT4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT4A1 BINDING SITE, designated SEQ ID:33976, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86738] Another function of VGAM2560 is therefore inhibition of Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM_043609). Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT4A1. LOC202934 (Accession XM_117486) is another VGAM2560 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, desig-

nated SEQ ID:43463, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86739] Another function of VGAM2560 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC255465 (Accession XM_173206) is another VGAM2560 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46455, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86740] Another function of VGAM2560 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC54505 (Accession XM_042110) is another VGAM2560 host target gene. LOC54505 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC54505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54505 BINDING SITE, designated SEQ ID:33697, to the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, also designated SEQ ID:5271.

[86741] Another function of VGAM2560 is therefore inhibition of LOC54505 (Accession XM_042110). Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54505. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2561 (VGAM2561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86742] VGAM2561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2561 was detected is described hereinabove with reference to Figs. 1-8.

[86743] VGAM2561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86744] VGAM2561 gene encodes a VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2561 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2561 precursor RNA is designated SEQ ID:2547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2547 is located at position 8473 relative to the genome of Himetobi P Virus.

[86745] VGAM2561 precursor RNA folds onto itself, forming VGAM2561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[86746] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2561 folded precursor RNA into VGAM2561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2561 RNA is designated SEQ ID:5272, and is provided hereinbelow with reference to the sequence listing part.

[86747] VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2561 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86748] VGAM2561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2561 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2561 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86749] The complementary binding of VGAM2561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2561 host target RNA into VGAM2561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86750] It is appreciated that VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2561 host target genes. The mRNA of each one of this plurality of VGAM2561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2561 RNA, herein designated VGAM RNA, and which when bound by VGAM2561 RNA causes inhibition of translation of respective one or more VGAM2561 host target proteins.

[86751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2561 gene, herein designated VGAM GENE, on one or more VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86752] It is yet further appreciated that a function of VGAM2561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2561 correlate with, and may be deduced from, the identity of the host target genes which VGAM2561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86753] Nucleotide sequences of the VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2561 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2561 are further described hereinbelow with reference to Table 1.

[86754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2561 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2561 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86755] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2561 gene, herein designated VGAM is inhibition of expression of VGAM2561 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2561 correlate with, and may be deduced from, the identity of the target genes which VGAM2561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86756] Myotubular Myopathy 1 (MTM1, Accession NM_000252) is a VGAM2561 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:5791, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86757] A function of VGAM2561 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM_000252). Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1. Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Accession NM_021111) is another VGAM2561 host target gene. RECK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RECK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECK BINDING SITE, designated SEQ ID:22091, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86758] Another function of VGAM2561 is therefore inhibition of Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Accession NM_021111), a gene which plays a role in regulation of cancer progression and tumor angio-

genesis. Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECK. The function of RECK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.KIAA1915 (Accession XM_055481) is another VGAM2561 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36270, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86759] Another function of VGAM2561 is therefore inhibition of KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1915. PRO1617 (Accession NM_018587) is another VGAM2561 host target gene. PRO1617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PRO1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1617 BINDING SITE, designated SEQ ID:20664, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86760] Another function of VGAM2561 is therefore inhibition of PRO1617 (Accession NM_018587). Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1617. SE70-2 (Accession NM_022118) is another VGAM2561 host target gene. SE70-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SE70-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE70-2 BINDING SITE, designated SEQ ID:22664, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86761] Another function of VGAM2561 is therefore inhibition of SE70-2 (Accession NM_022118). Accordingly, utilities of

VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE70-2. Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489) is another VGAM2561 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:28561, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86762] Another function of VGAM2561 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489). Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10. LOC157273 (Accession XM_098743) is another VGAM2561 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41787, to the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, also designated SEQ ID:5272.

[86763] Another function of VGAM2561 is therefore inhibition of LOC157273 (Accession XM_098743). Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2562 (VGAM2562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86764] VGAM2562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2562 was detected is described hereinabove with reference to Figs. 1-8.

[86765] VGAM2562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM2562 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[86766] VGAM2562 gene encodes a VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2562 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2562 precursor RNA is designated SEQ ID:2548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2548 is located at position 7594 relative to the genome of Himetobi P Virus.

[86767] VGAM2562 precursor RNA folds onto itself, forming VGAM2562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86768] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2562 folded precursor RNA into VGAM2562

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2562 RNA is designated SEQ ID:5273, and is provided hereinbelow with reference to the sequence listing part.

[86769] VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2562 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86770] VGAM2562 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2562 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86771] The complementary binding of VGAM2562 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2562 host target RNA into VGAM2562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[86772] It is appreciated that VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2562 host target genes. The mRNA of each one of this plurality of VGAM2562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2562 RNA, herein designated VGAM RNA, and which when bound by VGAM2562 RNA causes inhibition of translation of respective one or more VGAM2562 host target proteins.

[86773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2562 gene, herein designated VGAM GENE, on one or more VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86774] It is yet further appreciated that a function of VGAM2562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2562 correlate with, and may be deduced from, the identity of the host target genes which VGAM2562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86775] Nucleotide sequences of the VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2562 are further described hereinbelow with reference to Table 1.

[86776] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2562 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86777] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2562 gene, herein designated VGAM is inhibition of expression of VGAM2562 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2562 correlate with, and may be deduced from, the identity of the target genes which VGAM2562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86778] AS3 (Accession NM_015928) is a VGAM2562 host target gene. AS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE, designated SEQ ID:18050, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86779] A function of VGAM2562 is therefore inhibition of AS3 (Accession NM_015928), a gene which inhibits cell proloferation. Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393.CD164 Antigen, Sialomucin (CD164, Accession NM_006016) is another VGAM2562 host target gene. CD164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD164 BINDING SITE, designated SEQ ID:12630, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86780] Another function of VGAM2562 is therefore inhibition of CD164 Antigen, Sialomucin (CD164, Accession NM_006016), a gene which plays a role in hematopoiesis by facilitating the adhesion of CD34+ cells to bone marrow stroma and negatively regulates CD34+ hematopoi-

etic progenitor cell growth. Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD164. The function of CD164 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.Cytosolic Ovarian Carcinoma Antigen 1 (COVA1, Accession XM_055323) is another VGAM2562 host target gene. COVA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COVA1 BINDING SITE, designated SEQ ID:36265, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86781] Another function of VGAM2562 is therefore inhibition of Cytosolic Ovarian Carcinoma Antigen 1 (COVA1, Accession XM_055323). Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COVA1. FLJ11273 (Accession NM_018374) is another VGAM2562 host target

gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ ID:20392, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86782] Another function of VGAM2562 is therefore inhibition of FLJ11273 (Accession NM_018374). Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. KIAA0092 (Accession NM_014679) is another VGAM2562 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16152, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86783] Another function of VGAM2562 is therefore inhibition of KIAA0092 (Accession NM_014679). Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0092. LIN-28 (Accession NM_024674) is another VGAM2562 host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BINDING SITE, designated SEQ ID:23978, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86784] Another function of VGAM2562 is therefore inhibition of LIN-28 (Accession NM_024674). Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28. Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438) is another VGAM2562 host target gene. NUDT12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT12, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT12 BINDING SITE, designated SEQ ID:25448, to the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, also designated SEQ ID:5273.

[86785] Another function of VGAM2562 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438). Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2563 (VGAM2563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86786] VGAM2563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2563 was detected is described hereinabove with reference to Figs. 1-8.

[86787] VGAM2563 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Himetobi P Virus. VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86788] VGAM2563 gene encodes a VGAM2563 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2563 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2563 precursor RNA is designated SEQ ID:2549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2549 is located at position 8878 relative to the genome of Himetobi P Virus.

[86789] VGAM2563 precursor RNA folds onto itself, forming VGAM2563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86790] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2563 folded precursor RNA into VGAM2563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2563 RNA is designated SEQ ID:5274, and is provided hereinbelow with reference to the sequence listing part.

[86791] VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2563 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86792] VGAM2563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2563 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86793] The complementary binding of VGAM2563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2563

host target RNA into VGAM2563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86794] It is appreciated that VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2563 host target genes. The mRNA of each one of this plurality of VGAM2563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2563 RNA, herein designated VGAM RNA, and which when bound by VGAM2563 RNA causes inhibition of translation of respective one or more VGAM2563 host target proteins.

[86795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2563 gene, herein designated VGAM GENE, on one or more VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86796] It is yet further appreciated that a function of VGAM2563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2563 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM2563 correlate with, and may be deduced from, the identity of the host target genes which VGAM2563 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86797] Nucleotide sequences of the VGAM2563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2563 are further

described hereinbelow with reference to Table 1.

[86798] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2563 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86799] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2563 gene, herein designated VGAM is inhibition of expression of VGAM2563 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2563 correlate with, and may be deduced from, the identity of the target genes which VGAM2563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86800] LOC222484 (Accession XM_169424) is a VGAM2563 host target gene. LOC222484 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222484 BINDING SITE,

designated SEQ ID:45297, to the nucleotide sequence of VGAM2563 RNA, herein designated VGAM RNA, also designated SEQ ID:5274.

[86801] A function of VGAM2563 is therefore inhibition of LOC222484 (Accession XM_169424). Accordingly, utilities of VGAM2563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222484. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2564 (VGAM2564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86802] VGAM2564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2564 was detected is described hereinabove with reference to Figs. 1-8.

[86803] VGAM2564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86804] VGAM2564 gene encodes a VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2564 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2564 precursor RNA is designated SEQ ID:2550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2550 is located at position 3567 relative to the genome of Triatoma Virus.

[86805] VGAM2564 precursor RNA folds onto itself, forming VGAM2564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86806] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2564 folded precursor RNA into VGAM2564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2564 RNA is designated SEQ ID:5275, and is provided hereinbelow with reference to the sequence listing part.

[86807] VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2564 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86808] VGAM2564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2564 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86809] The complementary binding of VGAM2564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2564 host target RNA into VGAM2564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86810] It is appreciated that VGAM2564 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2564 host target genes. The mRNA of each one of this plurality of VGAM2564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2564 RNA, herein designated VGAM RNA, and which when bound by VGAM2564 RNA causes inhibition of translation of respective one or more VGAM2564 host target proteins.

[86811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2564 gene, herein designated VGAM GENE, on one or more VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86812] It is yet further appreciated that a function of VGAM2564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2564 correlate with, and may be deduced from, the identity of the host target genes which VGAM2564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86813] Nucleotide sequences of the VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2564 are further described hereinbelow with reference to Table 1.

[86814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2564 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86815] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2564 gene, herein designated VGAM is inhibition of expression of VGAM2564 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2564 correlate with, and may be deduced from, the identity of the target genes which VGAM2564 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86816] Active BCR-related Gene (ABR, Accession NM_001092) is a VGAM2564 host target gene. ABR BINDING SITE1 and ABR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE1 and ABR BINDING SITE2, designated SEQ ID:6749 and SEQ ID:22494 respectively, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86817] A function of VGAM2564 is therefore inhibition of Active BCR-related Gene (ABR, Accession NM_001092), a gene which gtpase-activating protein for rac and cdc42. Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABR. The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM489.Profilin 2 (PFN2, Accession NM_002628) is another VGAM2564 host target gene. PFN2 BINDING SITE1 and PFN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PFN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFN2 BINDING SITE1 and PFN2 BINDING SITE2, designated SEQ ID:8488 and SEQ ID:27581 respectively, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86818] Another function of VGAM2564 is therefore inhibition of Profilin 2 (PFN2, Accession NM_002628). Accordingly, utilities of VGAM2564 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PFN2. DKFZP434P211 (Accession NM_014549) is another VGAM2564 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15870, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86819] Another function of VGAM2564 is therefore inhibition of DKFZP434P211 (Accession NM_014549). Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. DKFZP586F1318 (Accession NM_015677) is another VGAM2564 host target gene. DKFZP586F1318 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586F1318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP586F1318 BINDING SITE, designated SEQ ID:17904, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86820] Another function of VGAM2564 is therefore inhibition of DKFZP586F1318 (Accession NM_015677). Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1318. LOC145009 (Accession XM_016472) is another VGAM2564 host target gene. LOC145009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145009 BINDING SITE, designated SEQ ID:30261, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86821] Another function of VGAM2564 is therefore inhibition of LOC145009 (Accession XM_016472). Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145009. LOC150213 (Accession XM_059324) is another VGAM2564 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36961, to the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, also designated SEQ ID:5275.

[86822] Another function of VGAM2564 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC255027 (Accession XM_170806) is another VGAM2564 host target gene. LOC255027 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255027 BINDING SITE, designated SEQ ID:45572, to the nucleotide sequence of VGAM2564 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5275.

[86823] Another function of VGAM2564 is therefore inhibition of LOC255027 (Accession XM_170806). Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255027. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2565 (VGAM2565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86824] VGAM2565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2565 was detected is described hereinabove with reference to Figs. 1-8.

[86825] VGAM2565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86826] VGAM2565 gene encodes a VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2565 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2565 precursor RNA is designated SEQ ID:2551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2551 is located at position 1775 relative to the genome of Triatoma Virus.

[86827] VGAM2565 precursor RNA folds onto itself, forming VGAM2565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86828] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2565 folded precursor RNA into VGAM2565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2565 RNA is designated SEQ ID:5276, and is provided hereinbelow with reference to the sequence listing part.

[86829] VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2565 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86830] VGAM2565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2565 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86831] The complementary binding of VGAM2565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2565 host target RNA into VGAM2565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86832] It is appreciated that VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2565 host target genes. The mRNA of

each one of this plurality of VGAM2565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2565 RNA, herein designated VGAM RNA, and which when bound by VGAM2565 RNA causes inhibition of translation of respective one or more VGAM2565 host target proteins.

[86833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2565 gene, herein designated VGAM GENE, on one or more VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[86834] It is yet further appreciated that a function of VGAM2565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2565 correlate with, and may be deduced from, the identity of the host target genes which VGAM2565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86835] Nucleotide sequences of the VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2565 are further described hereinbelow with reference to Table 1.

[86836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2565 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2565 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86837] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2565 gene, herein designated VGAM is inhibition of expression of VGAM2565 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2565 correlate with, and may be deduced from, the identity of the target genes which VGAM2565 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86838] Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM_022051) is a VGAM2565 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22578, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86839] A function of VGAM2565 is therefore inhibition of Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM_022051), a gene which is expressed in the cytoplasm of arterial

smooth muscle cells. Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216.Lysosomal-associated Membrane Protein 1 (LAMP1, Accession NM_005561) is another VGAM2565 host target gene. LAMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP1 BINDING SITE, designated SEQ ID:12089, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86840] Another function of VGAM2565 is therefore inhibition of Lysosomal-associated Membrane Protein 1 (LAMP1, Accession NM_005561), a gene which presents carbohydrate ligands to selectins. Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP1. The func-

tion of LAMP1 has been established by previous studies. The 120-kD lysosomal membrane glycoprotein is an acidic, heavily glycosylated membrane protein enriched in the lysosomal membrane. By using an oligonucleotide probe corresponding to the amino terminus of rat lgp120, Howe et al. (1988) isolated and characterized cDNA clones containing the entire coding region. The deduced amino acid sequence demonstrated that the rat LGP120 contains a putative signal peptide, 18 sites for N-linked glycosylation, a single membrane-spanning segment, and a short (11 amino acid) cytosolic tail. LGP120 showed similarity to 2 other lysosomal membrane proteins and showed a high degree of conservation in domain organization and primary structure with the proteins in other species. Viitala et al. (1988) reported the complete amino acid sequence for the human lysosome-associated membrane glycoprotein with M(r) about 120,000. The amino acid sequence, which was deduced from analysis of the cDNA, contains 385 amino acid residues. By means of in situ hybridization, Mattei et al. (1990) assigned the LAMP1 gene to 13q34. A related gene, which may be a pseudogene, mapped to 12p13.3. The hybridization of LAMP1 cDNA to 12p13.3 was observed even when probes representing

different portions of the LAMP1 cDNA were used. Although LAMP1 contains a functional hinge region, it has a disulfide arrangement different from that observed in members of the immunoglobulin superfamily and thus may represent a new family of membrane glycoproteins. The amino acid sequence of LAMP1 is more homologous to corresponding molecules from other species than it is to LAMP2 (OMIM Ref. No. 309060). Furthermore, LAMP1 and LAMP2 are immunologically distinguishable from each other. Thus it was proposed that LAMP1 and LAMP2 diverged relatively early in evolution but that LAMP1 (and possibly LAMP2) structures have been strongly conserved. Using Southern hybridization in hamster/human hybrid cell panels, Schleutker et al. (1991) confirmed the assignment of the LAMP1 gene to chromosome 13. Furthermore, Schleutker et al. (1991) demonstrated absence of genetic linkage of either LAMP1 or LAMP2 with Salla disease (OMIM Ref. No. 604369), a condition in which defective function of a lysosomal membrane transporter protein is the probable cause of accumulation of sialic acid in lysosomes. Bermingham et al. (1996) demonstrated that the Lamp1 gene is located on mouse chromosome 8. They could find no evidence that it is the site of the mutation in

mnd (motorneuron degeneration) mice.

[86841] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[86842] Bermingham, N. A.; Martin, J. E.; Fisher, E. M. C. : The mouse lysosomal membrane protein 1 gene as a candidate for the motorneuron degeneration (mnd) locus. Genomics 32: 266-271, 1996. ; and

[86843] Howe, C. L.; Granger, B. L.; Hull, M.; Green, S. A.; Gabel, C. A.; Helenius, A.; Mellman, I. : Derived protein sequence, oligosaccharides, and membrane insertion of the 120-kDa lysosomal.

[86844] Further studies establishing the function and utilities of LAMP1 are found in John Hopkins OMIM database record ID 153330, and in sited publications numbered 2951-2955 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM_002309) is another VGAM2565 host target gene. LIF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:8093, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86845] Another function of VGAM2565 is therefore inhibition of Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM_002309). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF. SET Translocation (myeloid leukemia-associated) (SET, Accession NM_003011) is another VGAM2565 host target gene. SET BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SET BINDING SITE, designated SEQ ID:8921, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86846] Another function of VGAM2565 is therefore inhibition of SET Translocation (myeloid leukemia-associated) (SET, Accession NM_003011). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SET. Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396) is another VGAM2565 host target gene. VPS41 BINDING SITE1 and VPS41 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VPS41, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE1 and VPS41 BINDING SITE2, designated SEQ ID:15734 and SEQ ID:27934 respectively, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86847] Another function of VGAM2565 is therefore inhibition of Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41. CDV-1 (Accession NM_031473) is another VGAM2565 host target gene. CDV-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDV-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CDV-1 BINDING SITE, designated SEQ ID:25539, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86848] Another function of VGAM2565 is therefore inhibition of CDV-1 (Accession NM_031473). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDV-1. Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989) is another VGAM2565 host target gene. CSAD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSAD BINDING SITE, designated SEQ ID:18082, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86849] Another function of VGAM2565 is therefore inhibition of Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CSAD. CSL4 (Accession NM_016046) is another VGAM2565 host target gene. CSL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSL4 BINDING SITE, designated SEQ ID:18124, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86850] Another function of VGAM2565 is therefore inhibition of CSL4 (Accession NM_016046). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSL4. ENDOFIN (Accession NM_014733) is another VGAM2565 host target gene. ENDOFIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENDOFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOFIN BINDING SITE, designated SEQ ID:16367, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5276.

[86851] Another function of VGAM2565 is therefore inhibition of ENDOFIN (Accession NM_014733). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOFIN. FLJ11160 (Accession NM_018344) is another VGAM2565 host target gene. FLJ11160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11160 BINDING SITE, designated SEQ ID:20351, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86852] Another function of VGAM2565 is therefore inhibition of FLJ11160 (Accession NM_018344). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11160. KIAA0527 (Accession XM_171054) is another VGAM2565 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0527, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45840, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86853] Another function of VGAM2565 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA1900 (Accession XM_055299) is another VGAM2565 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36258, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86854] Another function of VGAM2565 is therefore inhibition of KIAA1900 (Accession XM_055299). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1900. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM2565 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18732, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86855] Another function of VGAM2565 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Phospholipid Scramblase 4 (PLSCR4, Accession NM_020353) is another VGAM2565 host target gene. PLSCR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLSCR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PLSCR4 BINDING SITE, designated SEQ ID:21620, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86856] Another function of VGAM2565 is therefore inhibition of Phospholipid Scramblase 4 (PLSCR4, Accession NM_020353). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR4. PR Domain Containing 8 (PRDM8, Accession NM_020226) is another VGAM2565 host target gene. PRDM8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRDM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM8 BINDING SITE, designated SEQ ID:21489, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86857] Another function of VGAM2565 is therefore inhibition of PR Domain Containing 8 (PRDM8, Accession NM_020226). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PRDM8. Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM2565 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17595, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86858] Another function of VGAM2565 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC118611 (Accession XM_061055) is another VGAM2565 host target gene. LOC118611 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118611 BINDING SITE, desig-

nated SEQ ID:37185, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86859] Another function of VGAM2565 is therefore inhibition of LOC118611 (Accession XM_061055). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118611. LOC130026 (Accession NM_138468) is another VGAM2565 host target gene. LOC130026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130026 BINDING SITE, designated SEQ ID:28817, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86860] Another function of VGAM2565 is therefore inhibition of LOC130026 (Accession NM_138468). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130026. LOC153810 (Accession XM_087778) is another VGAM2565 host target gene. LOC153810 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153810 BINDING SITE, designated SEQ ID:39410, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86861] Another function of VGAM2565 is therefore inhibition of LOC153810 (Accession XM_087778). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153810. LOC221312 (Accession XM_166314) is another VGAM2565 host target gene. LOC221312 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221312 BINDING SITE, designated SEQ ID:44138, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86862] Another function of VGAM2565 is therefore inhibition of

LOC221312 (Accession XM_166314). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221312. LOC256080 (Accession XM_174235) is another VGAM2565 host target gene. LOC256080 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256080 BINDING SITE, designated SEQ ID:46584, to the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, also designated SEQ ID:5276.

[86863] Another function of VGAM2565 is therefore inhibition of LOC256080 (Accession XM_174235). Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2566 (VGAM2566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[86864] VGAM2566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2566 was detected is described hereinabove with reference to Figs. 1-8.

[86865] VGAM2566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86866] VGAM2566 gene encodes a VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2566 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2566 precursor RNA is designated SEQ ID:2552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2552 is located at position 2022 relative to the genome of Triatoma Virus.

[86867] VGAM2566 precursor RNA folds onto itself, forming VGAM2566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86868] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2566 folded precursor RNA into VGAM2566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2566 RNA is designated SEQ ID:5277, and is provided hereinbelow with reference to the sequence listing part.

[86869] VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2566 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86870] VGAM2566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2566 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[86871] The complementary binding of VGAM2566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2566 host target RNA into VGAM2566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86872] It is appreciated that VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2566 host target genes. The mRNA of each one of this plurality of VGAM2566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2566 RNA, herein designated VGAM RNA, and which when bound by VGAM2566 RNA causes inhibition of translation of respective one or more VGAM2566 host target proteins.

[86873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2566 gene, herein designated VGAM GENE, on one

or more VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86874] It is yet further appreciated that a function of VGAM2566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2566 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2566 correlate with, and may be deduced from, the identity of the host target genes which VGAM2566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86875] Nucleotide sequences of the VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2566 are further described hereinbelow with reference to Table 1.

[86876] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2566 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86877] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2566 gene, herein designated VGAM is inhibition of expression of VGAM2566 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2566 correlate with, and may be deduced from, the identity of the target genes which VGAM2566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86878] Unc-119 Homolog (C. elegans) (UNC119, Accession

NM_054035) is a VGAM2566 host target gene. UNC119 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC119, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC119 BINDING SITE, designated SEQ ID:27647, to the nucleotide sequence of VGAM2566 RNA, herein designated VGAM RNA, also designated SEQ ID:5277.

[86879] A function of VGAM2566 is therefore inhibition of Unc-119 Homolog (C. elegans) (UNC119, Accession NM_054035), a gene which is expressed in the retina and may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. Accordingly, utilities of VGAM2566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC119. The function of UNC119 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1044.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention,

referred to here as Viral Genomic Address Messenger 2567 (VGAM2567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86880] VGAM2567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2567 was detected is described hereinabove with reference to Figs. 1-8.

[86881] VGAM2567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86882] VGAM2567 gene encodes a VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2567 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2567 precursor RNA is designated SEQ ID:2553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2553 is located at position 3811 relative to the genome of Triatoma Virus.

[86883] VGAM2567 precursor RNA folds onto itself, forming VGAM2567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86884] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2567 folded precursor RNA into VGAM2567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2567 RNA is designated SEQ ID:5278, and is provided hereinbelow with reference to the sequence listing part.

[86885] VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2567 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2567 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86886] VGAM2567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2567 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86887] The complementary binding of VGAM2567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2567 host target RNA into VGAM2567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86888] It is appreciated that VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2567 host target genes. The mRNA of each one of this plurality of VGAM2567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2567 RNA, herein designated VGAM RNA, and which when bound by VGAM2567 RNA causes inhibition of translation of respective one or more VGAM2567 host target proteins.

[86889] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2567 gene, herein designated VGAM GENE, on one or more VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86890] It is yet further appreciated that a function of VGAM2567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2567 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2567 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86891] Nucleotide sequences of the VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2567 are further described hereinbelow with reference to Table 1.

[86892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2567 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86893] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2567 gene, herein designated VGAM is inhibition of expression of VGAM2567 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2567 correlate with, and may be deduced from, the identity of the target genes which VGAM2567

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86894] Amiloride-sensitive Cation Channel 1, Neuronal (degenerin) (ACCN1, Accession NM_001094) is a VGAM2567 host target gene. ACCN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACCN1 BINDING SITE, designated SEQ ID:6752, to the nucleotide sequence of VGAM2567 RNA, herein designated VGAM RNA, also designated SEQ ID:5278.

[86895] A function of VGAM2567 is therefore inhibition of Amiloride-sensitive Cation Channel 1, Neuronal (degenerin) (ACCN1, Accession NM_001094), a gene which non-voltage-gated amiloride-sensitive cation channel permeable for sodium, potassium and lithium. Accordingly, utilities of VGAM2567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN1. The function of ACCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM1095.PB1 (Accession NM_018313) is another VGAM2567 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:20308, to the nucleotide sequence of VGAM2567 RNA, herein designated VGAM RNA, also designated SEQ ID:5278.

[86896] Another function of VGAM2567 is therefore inhibition of PB1 (Accession NM_018313). Accordingly, utilities of VGAM2567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2568 (VGAM2568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86897] VGAM2568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2568 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[86898] VGAM2568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86899] VGAM2568 gene encodes a VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2568 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2568 precursor RNA is designated SEQ ID:2554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2554 is located at position 4293 relative to the genome of Triatoma Virus.

[86900] VGAM2568 precursor RNA folds onto itself, forming VGAM2568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2568 folded precursor RNA into VGAM2568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2568 RNA is designated SEQ ID:5279, and is provided hereinbelow with reference to the sequence listing part.

[86902] VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2568 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86903] VGAM2568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2568 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86904] The complementary binding of VGAM2568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2568 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2568 host target RNA into VGAM2568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86905] It is appreciated that VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2568 host target genes. The mRNA of each one of this plurality of VGAM2568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2568 RNA, herein designated VGAM RNA, and which when bound by VGAM2568 RNA causes inhibition of translation of respective one or more VGAM2568 host target proteins.

[86906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2568 gene, herein designated VGAM GENE, on one or more VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86907] It is yet further appreciated that a function of VGAM2568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2568 correlate with, and may be deduced from, the identity of the host target genes which VGAM2568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86908] Nucleotide sequences of the VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2568 are further described hereinbelow with reference to Table 1.

[86909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2568 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2568 gene, herein designated VGAM is inhibition of expression of VGAM2568 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2568 correlate with, and may be deduced from, the identity of the target genes which VGAM2568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86911] H2A Histone Family, Member J (H2AFJ, Accession NM_018267) is a VGAM2568 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AFJ, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:20239, to the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, also designated SEQ ID:5279.

[86912] A function of VGAM2568 is therefore inhibition of H2A Histone Family, Member J (H2AFJ, Accession NM_018267). Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. KIAA0061 (Accession XM_043094) is another VGAM2568 host target gene. KIAA0061 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0061 BINDING SITE, designated SEQ ID:33892, to the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, also designated SEQ ID:5279.

[86913] Another function of VGAM2568 is therefore inhibition of KIAA0061 (Accession XM_043094). Accordingly, utilities of VGAM2568 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0061. KIAA1655 (Accession XM_039442) is another VGAM2568 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33083, to the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, also designated SEQ ID:5279.

[86914] Another function of VGAM2568 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446) is another VGAM2568 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ

ID:28215, to the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, also designated SEQ ID:5279.

[86915] Another function of VGAM2568 is therefore inhibition of Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446). Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. LOC147947 (Accession XM_085974) is another VGAM2568 host target gene. LOC147947 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147947, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147947 BINDING SITE, designated SEQ ID:38424, to the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, also designated SEQ ID:5279.

[86916] Another function of VGAM2568 is therefore inhibition of LOC147947 (Accession XM_085974). Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147947. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2569 (VGAM2569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86917] VGAM2569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2569 was detected is described hereinabove with reference to Figs. 1-8.

[86918] VGAM2569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86919] VGAM2569 gene encodes a VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2569 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2569 precursor RNA is designated SEQ ID:2555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2555 is located at position 5389 relative to the genome of Triatoma Virus.

[86920] VGAM2569 precursor RNA folds onto itself, forming VGAM2569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86921] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2569 folded precursor RNA into VGAM2569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2569 RNA is designated SEQ ID:5280, and is provided hereinbelow with reference to the sequence listing part.

[86922] VGAM2569 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2569 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86923] VGAM2569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2569 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2569 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86924] The complementary binding of VGAM2569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2569 host target RNA into VGAM2569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86925] It is appreciated that VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2569 host target genes. The mRNA of each one of this plurality of VGAM2569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2569 RNA, herein designated VGAM RNA, and which when bound by VGAM2569 RNA causes inhibition of translation of respective one or more

VGAM2569 host target proteins.

[86926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2569 gene, herein designated VGAM GENE, on one or more VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86927] It is yet further appreciated that a function of VGAM2569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific

functions, and accordingly utilities, of VGAM2569 correlate with, and may be deduced from, the identity of the host target genes which VGAM2569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86928] Nucleotide sequences of the VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2569 are further described hereinbelow with reference to Table 1.

[86929] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2569 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86930] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2569 gene, herein designated VGAM is inhibition of expression of VGAM2569 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2569 correlate with, and may be deduced from, the identity of the target genes which VGAM2569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86931] Chloride Channel 3 (CLCN3, Accession NM_001829) is a VGAM2569 host target gene. CLCN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLCN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN3 BINDING SITE, designated SEQ ID:7564, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86932] A function of VGAM2569 is therefore inhibition of Chloride Channel 3 (CLCN3, Accession NM_001829), a gene which play a role in the neural cell function through regulation of membrane excitability. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN3. The function of CLCN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM1332.Dual Oxidase 2 (DUOX2, Accession NM_014080) is another VGAM2569 host target gene. DUOX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DUOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUOX2 BINDING SITE, designated SEQ ID:15306, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86933] Another function of VGAM2569 is therefore inhibition of Dual Oxidase 2 (DUOX2, Accession NM_014080), a gene which is a calcium-dependent flavoprotein component of thyroid NADPH oxidase. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUOX2. The function of DUOX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1169.Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019) is another

VGAM2569 host target gene. FLT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLT1 BINDING SITE, designated SEQ ID:7763, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86934] Another function of VGAM2569 is therefore inhibition of Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT1. Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473) is another VGAM2569 host target gene. FOXE1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXE1 BINDING SITE, designated SEQ

ID:10782, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86935] Another function of VGAM2569 is therefore inhibition of Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE1. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_054110) is another VGAM2569 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:27649, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86936] Another function of VGAM2569 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7,

Accession NM_054110). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162) is another VGAM2569 host target gene. NFATC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFATC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC1 BINDING SITE, designated SEQ ID:12815, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86937] Another function of VGAM2569 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162), a gene which regulates he activation,proliferation,differentiation and programmed death of ymphoid and nonlymphoid cells. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NFATC1. The function of NFATC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM123.Peroxisomal Farnesylated Protein (PXF, Accession NM_002857) is another VGAM2569 host target gene. PXF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PXF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXF BINDING SITE, designated SEQ ID:8748, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86938] Another function of VGAM2569 is therefore inhibition of Peroxisomal Farnesylated Protein (PXF, Accession NM_002857), a gene which may function in peroxisomal biogenesis or assembly. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXF. The function of PXF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.Vacuolar Protein Sorting 26 (yeast) (VPS26,

Accession NM_004896) is another VGAM2569 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11323, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86939] Another function of VGAM2569 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896), a gene which is a sorting protein- ensures the proper delivery of organelle-specific proteins. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315.Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758) is another VGAM2569 host target gene. AGMAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by AGMAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:24104, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86940] Another function of VGAM2569 is therefore inhibition of Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGMAT. DKFZp761O17121 (Accession NM_032287) is another VGAM2569 host target gene. DKFZp761O17121 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:26044, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86941] Another function of VGAM2569 is therefore inhibition of

DKFZp761O17121 (Accession NM_032287). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121. Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503) is another VGAM2569 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 through JAM1 BINDING SITE4, designated SEQ ID:29335, SEQ ID:29346, SEQ ID:29326 and SEQ ID:18859 respectively, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86942] Another function of VGAM2569 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. KIAA1573 (Accession XM_031545) is another VGAM2569 host target gene. KIAA1573 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by KIAA1573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1573 BINDING SITE, designated SEQ ID:31412, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86943] Another function of VGAM2569 is therefore inhibition of KIAA1573 (Accession XM_031545). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1573. KIAA1750 (Accession XM_043067) is another VGAM2569 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33871, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86944] Another function of VGAM2569 is therefore inhibition of

KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. MGC11034 (Accession NM_031453) is another VGAM2569 host target gene. MGC11034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11034 BINDING SITE, designated SEQ ID:25469, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86945] Another function of VGAM2569 is therefore inhibition of MGC11034 (Accession NM_031453). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11034. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_001489) is another VGAM2569 host target gene. NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:7231, SEQ ID:27179 and SEQ ID:27185 respectively, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86946] Another function of VGAM2569 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM_001489). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM_019055) is another VGAM2569 host target gene. ROBO4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ROBO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO4 BINDING SITE, designated SEQ ID:21134, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86947] Another function of VGAM2569 is therefore inhibition of Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM_019055). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO4. LOC154860 (Accession XM_098623) is another VGAM2569 host target gene. LOC154860 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154860 BINDING SITE, designated SEQ ID:41733, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86948] Another function of VGAM2569 is therefore inhibition of LOC154860 (Accession XM_098623). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154860. LOC220522 (Accession XM_018306) is another VGAM2569 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220522, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30350, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86949] Another function of VGAM2569 is therefore inhibition of LOC220522 (Accession XM_018306). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. LOC253596 (Accession XM_170934) is another VGAM2569 host target gene. LOC253596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253596 BINDING SITE, designated SEQ ID:45721, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86950] Another function of VGAM2569 is therefore inhibition of LOC253596 (Accession XM_170934). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253596. LOC93268 (Accession XM_050158) is another VGAM2569 host target gene. LOC93268 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93268 BINDING SITE, designated SEQ ID:35587, to the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, also designated SEQ ID:5280.

[86951] Another function of VGAM2569 is therefore inhibition of LOC93268 (Accession XM_050158). Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2570 (VGAM2570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86952] VGAM2570 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2570 was detected is described hereinabove with reference to Figs. 1-8.

[86953] VGAM2570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86954] VGAM2570 gene encodes a VGAM2570 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2570 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2570 precursor RNA is designated SEQ ID:2556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2556 is located at position 5274 relative to the genome of Triatoma Virus.

[86955] VGAM2570 precursor RNA folds onto itself, forming VGAM2570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86956] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2570 folded precursor RNA into VGAM2570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2570 RNA is designated SEQ ID:5281, and is provided hereinbelow with reference to the sequence listing part.

[86957] VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2570 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86958] VGAM2570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2570 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86959] The complementary binding of VGAM2570 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2570 host target RNA into VGAM2570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86960] It is appreciated that VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2570 host target genes. The mRNA of each one of this plurality of VGAM2570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2570 RNA, herein designated VGAM RNA, and which when bound by VGAM2570 RNA causes inhibition of translation of respective one or more VGAM2570 host target proteins.

[86961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2570 gene, herein designated VGAM GENE, on one or more VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86962] It is yet further appreciated that a function of VGAM2570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2570 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2570 correlate with, and may be deduced from, the identity of the host target genes which VGAM2570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86963] Nucleotide sequences of the VGAM2570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2570 are further described hereinbelow with reference to Table 1.

[86964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2570 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86965] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2570 gene, herein designated VGAM is inhibition of expression of VGAM2570 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2570 correlate with, and may be deduced from, the identity of the target genes which VGAM2570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86966] Fibrinogen, A Alpha Polypeptide (FGA, Accession NM_000508) is a VGAM2570 host target gene. FGA BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by FGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGA BINDING SITE, designated SEQ ID:6119, to the nucleotide sequence of VGAM2570 RNA, herein designated VGAM RNA, also designated SEQ ID:5281.

[86967] A function of VGAM2570 is therefore inhibition of Fibrinogen, A Alpha Polypeptide (FGA, Accession NM_000508). Accordingly, utilities of VGAM2570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGA. XPO5 (Accession XM_166042) is another VGAM2570 host target gene. XPO5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPO5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPO5 BINDING SITE, designated SEQ ID:43839, to the nucleotide sequence of VGAM2570 RNA, herein designated VGAM RNA, also designated SEQ ID:5281.

[86968] Another function of VGAM2570 is therefore inhibition of XPO5 (Accession XM_166042). Accordingly, utilities of

VGAM2570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO5. LOC51333 (Accession NM_016643) is another VGAM2570 host target gene. LOC51333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51333 BINDING SITE, designated SEQ ID:18750, to the nucleotide sequence of VGAM2570 RNA, herein designated VGAM RNA, also designated SEQ ID:5281.

[86969] Another function of VGAM2570 is therefore inhibition of LOC51333 (Accession NM_016643). Accordingly, utilities of VGAM2570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2571 (VGAM2571) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86970] VGAM2571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2571 was detected is described hereinabove with reference to Figs. 1-8.

[86971] VGAM2571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86972] VGAM2571 gene encodes a VGAM2571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2571 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2571 precursor RNA is designated SEQ ID:2557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2557 is located at position 5836 relative to the genome of Triatoma Virus.

[86973] VGAM2571 precursor RNA folds onto itself, forming VGAM2571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86974] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2571 folded precursor RNA into VGAM2571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2571 RNA is designated SEQ ID:5282, and is provided hereinbelow with reference to the sequence listing part.

[86975] VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2571 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[86976] VGAM2571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2571 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[86977] The complementary binding of VGAM2571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2571 host target RNA into VGAM2571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[86978] It is appreciated that VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2571 host target genes. The mRNA of each one of this plurality of VGAM2571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2571 RNA, herein designated VGAM RNA, and which when bound by VGAM2571 RNA causes inhibition of translation of respective one or more VGAM2571 host target proteins.

[86979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2571 gene, herein designated VGAM GENE, on one or more VGAM2571 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[86980] It is yet further appreciated that a function of VGAM2571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2571 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2571 correlate with, and may be deduced from, the identity of the host target genes which VGAM2571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[86981] Nucleotide sequences of the VGAM2571 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2571 are further described hereinbelow with reference to Table 1.

[86982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2571 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[86983] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2571 gene, herein designated VGAM is inhibition of expression of VGAM2571 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2571 correlate with, and may be deduced from, the identity of the target genes which VGAM2571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[86984] Ring Finger Protein (C3H2C3 type) 6 (RNF6, Accession NM_005977) is a VGAM2571 host target gene. RNF6

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF6 BINDING SITE, designated SEQ ID:12603, to the nucleotide sequence of VGAM2571 RNA, herein designated VGAM RNA, also designated SEQ ID:5282.

[86985] A function of VGAM2571 is therefore inhibition of Ring Finger Protein (C3H2C3 type) 6 (RNF6, Accession NM_005977), a gene which is a RING finger protein, may be a tumor suppressor. Accordingly, utilities of VGAM2571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF6. The function of RNF6 has been established by previous studies. By FISH and physical mapping, Macdonald et al. (1999) determined that RNF6 is located at 13q12.2 close to marker D13S1121, and that it is oriented from telomere to centromere. RNF6 was not disrupted by the t(4;13) translocation in the case of myeloproliferative disorder studied by Macdonald et al. (1999). MOLECULAR GENETICS By loss of heterozygosity (LOH) studies in esophageal squamous cell carcinoma (ESCC; 133239), Li et al. (2001)

identified an 800-kb region on chromosome 13q12.11 as the site of a potential tumor suppressor gene. Lo et al. (2002) screened the ATP8A2 (OMIM Ref. No. 605870) and RNF6 genes for mutations in 24 ESCC primary tumors and 16 tumor cell lines by direct sequencing of the PCR products that were amplified from each exon. They detected no mutations in ATP8A2, but identified 3 somatic mutations in the RNF6 gene in the ESCC primary tumors (604242.0001-604242.0003); 1 mutation was also found in a tumor cell line. Lo et al. (2002) concluded that RNF6 may be a tumor suppressor gene involved in the pathogenesis of ESCC.

[86986] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[86987] Lo, H. S.; Hu, N.; Gere, S.; Lu, N.; Su, H.; Goldstein, A. M.; Taylor, P. R.; Lee, M. P. : Identification of somatic mutations of the RNF6 gene in human esophageal squamous cell carcinoma. Cancer Res. 62: 4191-4193, 2002. ; and

[86988] Macdonald, D. H. C.; Lahiri, D.; Sampath, A.; Chase, A.; Sohal, J.; Cross, N. C. P. : Cloning and characterization of RNF6, a novel RING finger gene mapping to 13q12. Genomics 58: 94-97, 1.

[86989] Further studies establishing the function and utilities of RNF6 are found in John Hopkins OMIM database record ID 604242, and in sited publications numbered 5366-465 and 691 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.BCL2-associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM2571 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11301, to the nucleotide sequence of VGAM2571 RNA, herein designated VGAM RNA, also designated SEQ ID:5282.

[86990] Another function of VGAM2571 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM2571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. LOC143425 (Accession XM_113695) is another VGAM2571 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42349, to the nucleotide sequence of VGAM2571 RNA, herein designated VGAM RNA, also designated SEQ ID:5282.

[86991] Another function of VGAM2571 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM2571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC220936 (Accession XM_166137) is another VGAM2571 host target gene. LOC220936 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220936 BINDING SITE, designated SEQ ID:43931, to the nucleotide sequence of VGAM2571 RNA, herein designated VGAM RNA, also designated SEQ ID:5282.

[86992] Another function of VGAM2571 is therefore inhibition of LOC220936 (Accession XM_166137). Accordingly, utilities

of VGAM2571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220936. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2572 (VGAM2572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[86993] VGAM2572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2572 was detected is described hereinabove with reference to Figs. 1-8.

[86994] VGAM2572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[86995] VGAM2572 gene encodes a VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2572 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2572 precursor RNA is designated SEQ ID:2558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2558 is located at position 3076 relative to the genome of Triatoma Virus.

[86996] VGAM2572 precursor RNA folds onto itself, forming VGAM2572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[86997] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2572 folded precursor RNA into VGAM2572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2572 RNA is designated SEQ ID:5283, and

is provided hereinbelow with reference to the sequence listing part.

[86998] VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2572 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[86999] VGAM2572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2572 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87000] The complementary binding of VGAM2572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2572 host target RNA into VGAM2572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87001] It is appreciated that VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2572 host target genes. The mRNA of each one of this plurality of VGAM2572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2572 RNA, herein designated VGAM RNA, and which when bound by VGAM2572 RNA causes inhibition of translation of respective one or more VGAM2572 host target proteins.

[87002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2572 gene, herein designated VGAM GENE, on one or more VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87003] It is yet further appreciated that a function of VGAM2572 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2572 correlate with, and may be deduced from, the identity of the host target genes which VGAM2572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87004] Nucleotide sequences of the VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2572 are further described hereinbelow with reference to Table 1.

[87005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2572 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87006] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2572 gene, herein designated VGAM is inhibition of expression of VGAM2572 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2572 correlate with, and may be deduced from, the identity of the target genes which VGAM2572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87007] LENG4 (Accession NM_024298) is a VGAM2572 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23582, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87008] A function of VGAM2572 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Mucin 3B (MUC3B, Accession XM_168578) is another VGAM2572 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45255, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87009] Another function of VGAM2572 is therefore inhibition of Mucin 3B (MUC3B, Accession XM_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog,

Drosophila) (PDE4D, Accession XM_056815) is another VGAM2572 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36435, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87010] Another function of VGAM2572 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession

NM_001754) is another VGAM2572 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7502, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87011] Another function of VGAM2572 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM_001754). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406) is another VGAM2572 host target gene. YWHAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YWHAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of YWHAZ BINDING SITE, designated SEQ ID:9444, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87012] Another function of VGAM2572 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406), a gene which mediates signal transduction by binding to phosphorylated serine residues on a variety of signaling molecules. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAZ. The function of YWHAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM43.FEM-2 (Accession NM_014634) is another VGAM2572 host target gene. FEM-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEM-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM-2 BINDING SITE, designated SEQ ID:16009, to the nu-

cleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87013] Another function of VGAM2572 is therefore inhibition of FEM-2 (Accession NM_014634). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM-2. FLJ20514 (Accession NM_017856) is another VGAM2572 host target gene. FLJ20514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20514 BINDING SITE, designated SEQ ID:19532, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87014] Another function of VGAM2572 is therefore inhibition of FLJ20514 (Accession NM_017856). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20514. G4 (Accession XM_165712) is another VGAM2572 host target gene. G4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by G4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G4 BINDING SITE, designated SEQ ID:43735, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87015] Another function of VGAM2572 is therefore inhibition of G4 (Accession XM_165712). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G4. KIAA1036 (Accession NM_014909) is another VGAM2572 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17125, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87016] Another function of VGAM2572 is therefore inhibition of KIAA1036 (Accession NM_014909). Accordingly, utilities

of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1340 (Accession XM_044836) is another VGAM2572 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34298, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87017] Another function of VGAM2572 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463) is another VGAM2572 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ ID:9534, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87018] Another function of VGAM2572 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM2572 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10097, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87019] Another function of VGAM2572 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RNF8. LOC219376 (Accession XM_168147) is another VGAM2572 host target gene. LOC219376 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219376 BINDING SITE, designated SEQ ID:45069, to the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87020] Another function of VGAM2572 is therefore inhibition of LOC219376 (Accession XM_168147). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219376. LOC257554 (Accession XM_175149) is another VGAM2572 host target gene. LOC257554 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257554 BINDING SITE, designated SEQ ID:46642, to

the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, also designated SEQ ID:5283.

[87021] Another function of VGAM2572 is therefore inhibition of LOC257554 (Accession XM_175149). Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257554. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2573 (VGAM2573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87022] VGAM2573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2573 was detected is described hereinabove with reference to Figs. 1-8.

[87023] VGAM2573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87024] VGAM2573 gene encodes a VGAM2573 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2573 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2573 precursor RNA is designated SEQ ID:2559, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2559 is located at position 3368 relative to the genome of Triatoma Virus.

[87025] VGAM2573 precursor RNA folds onto itself, forming VGAM2573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87026] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2573 folded precursor RNA into VGAM2573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2573 RNA is designated SEQ ID:5284, and is provided hereinbelow with reference to the sequence listing part.

[87027] VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2573 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87028] VGAM2573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2573 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87029] The complementary binding of VGAM2573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2573 host target RNA into VGAM2573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87030] It is appreciated that VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2573 host target genes. The mRNA of each one of this plurality of VGAM2573 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2573 RNA, herein designated VGAM RNA, and which when bound by VGAM2573 RNA causes inhibition of translation of respective one or more VGAM2573 host target proteins.

[87031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2573 gene, herein designated VGAM GENE, on one or more VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87032] It is yet further appreciated that a function of VGAM2573 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2573 correlate with, and may be deduced from, the identity of the host target genes which VGAM2573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87033] Nucleotide sequences of the VGAM2573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2573 are further described hereinbelow with reference to Table 1.

[87034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2573 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87035] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2573 gene, herein designated VGAM is inhibition of expression of VGAM2573 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2573 correlate with, and may be deduced from, the identity of the target genes which VGAM2573 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87036] Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM_039627) is a VGAM2573 host target gene. CNTN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:33132, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87037] A function of VGAM2573 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession

XM_039627), a gene which may play a role in the initial growth and guidance of axons. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN3. The function of CNTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420.C-reactive Protein, Pentraxin-related (CRP, Accession XM_049673) is another VGAM2573 host target gene. CRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRP BINDING SITE, designated SEQ ID:35463, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87038] Another function of VGAM2573 is therefore inhibition of C-reactive Protein, Pentraxin-related (CRP, Accession XM_049673). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRP. Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function)

(ENTPD6, Accession NM_001247) is another VGAM2573 host target gene. ENTPD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENTPD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENTPD6 BINDING SITE, designated SEQ ID:6919, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87039] Another function of VGAM2573 is therefore inhibition of Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM_001247), a gene which might support glycosylation reactions in the golgi apparatus and, when released from cells, might catalyze the hydrolysis of extracellular nucleotides. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENTPD6. The function of ENTPD6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.5-methyltetrahydrofolate-homocysteine

Methyltransferase (MTR, Accession NM_000254) is another VGAM2573 host target gene. MTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTR BINDING SITE, designated SEQ ID:5795, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87040] Another function of VGAM2573 is therefore inhibition of 5-methyltetrahydrofolate-homocysteine Methyltransferase (MTR, Accession NM_000254). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTR. Protocadherin 11 X-linked (PCDH11X, Accession NM_032967) is another VGAM2573 host target gene. PCDH11X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH11X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE, designated SEQ

ID:26780, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87041] Another function of VGAM2573 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032967), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032971) is another VGAM2573 host target gene. PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11Y, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2, designated SEQ

ID:26813 and SEQ ID:26815 respectively, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87042] Another function of VGAM2573 is therefore inhibition of Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032971). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349) is another VGAM2573 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9366, SEQ ID:22518 and SEQ ID:6362 respectively, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87043] Another function of VGAM2573 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349), a gene which may play a role in sig-

naling for DNA repair. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.MGC12466 (Accession XM_086336) is another VGAM2573 host target gene. MGC12466 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE, designated SEQ ID:38609, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87044] Another function of VGAM2573 is therefore inhibition of MGC12466 (Accession XM_086336). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12466. Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506) is another VGAM2573 host target gene. OR7C1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OR7C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR7C1 BINDING SITE, designated SEQ ID:18961, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87045] Another function of VGAM2573 is therefore inhibition of Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR7C1. Oxysterol Binding Protein-like 6 (OSBPL6, Accession NM_032523) is another VGAM2573 host target gene. OSBPL6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL6 BINDING SITE, designated SEQ ID:26269, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ

ID:5284.

[87046] Another function of VGAM2573 is therefore inhibition of Oxysterol Binding Protein-like 6 (OSBPL6, Accession NM_032523). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL6. PCCX2 (Accession XM_038352) is another VGAM2573 host target gene. PCCX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCCX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCCX2 BINDING SITE, designated SEQ ID:32820, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87047] Another function of VGAM2573 is therefore inhibition of PCCX2 (Accession XM_038352). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCCX2. TUSP (Accession NM_020245) is another VGAM2573 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21521, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87048] Another function of VGAM2573 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC118738 (Accession XM_061125) is another VGAM2573 host target gene. LOC118738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118738 BINDING SITE, designated SEQ ID:37192, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87049] Another function of VGAM2573 is therefore inhibition of LOC118738 (Accession XM_061125). Accordingly, utilities

of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118738. LOC158056 (Accession XM_088463) is another VGAM2573 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39712, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87050] Another function of VGAM2573 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC163231 (Accession XM_092094) is another VGAM2573 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC163231 BINDING SITE, designated SEQ ID:40092, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87051] Another function of VGAM2573 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC205669 (Accession XM_120309) is another VGAM2573 host target gene. LOC205669 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205669 BINDING SITE, designated SEQ ID:43607, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87052] Another function of VGAM2573 is therefore inhibition of LOC205669 (Accession XM_120309). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205669. LOC219738 (Accession NM_145306) is another VGAM2573 host target gene. LOC219738 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219738 BINDING SITE, designated SEQ ID:29817, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87053] Another function of VGAM2573 is therefore inhibition of LOC219738 (Accession NM_145306). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219738. LOC253039 (Accession XM_171203) is another VGAM2573 host target gene. LOC253039 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253039 BINDING SITE, designated SEQ ID:45991, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87054] Another function of VGAM2573 is therefore inhibition of

LOC253039 (Accession XM_171203). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253039. LOC51337 (Accession NM_016647) is another VGAM2573 host target gene. LOC51337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51337 BINDING SITE, designated SEQ ID:18761, to the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, also designated SEQ ID:5284.

[87055] Another function of VGAM2573 is therefore inhibition of LOC51337 (Accession NM_016647). Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2574 (VGAM2574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[87056] VGAM2574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2574 was detected is described hereinabove with reference to Figs. 1-8.

[87057] VGAM2574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87058] VGAM2574 gene encodes a VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2574 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2574 precursor RNA is designated SEQ ID:2560, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2560 is located at position 2215 relative to the genome of Triatoma Virus.

[87059] VGAM2574 precursor RNA folds onto itself, forming VGAM2574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87060] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2574 folded precursor RNA into VGAM2574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2574 RNA is designated SEQ ID:5285, and is provided hereinbelow with reference to the sequence listing part.

[87061] VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2574 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87062] VGAM2574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2574 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[87063] The complementary binding of VGAM2574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2574 host target RNA into VGAM2574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87064] It is appreciated that VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2574 host target genes. The mRNA of each one of this plurality of VGAM2574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2574 RNA, herein designated VGAM RNA, and which when bound by VGAM2574 RNA causes inhibition of translation of respective one or more VGAM2574 host target proteins.

[87065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2574 gene, herein designated VGAM GENE, on one

or more VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87066] It is yet further appreciated that a function of VGAM2574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2574 correlate with, and may be deduced from, the identity of the host target genes which VGAM2574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87067] Nucleotide sequences of the VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2574 are further described hereinbelow with reference to Table 1.

[87068] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2574 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87069] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2574 gene, herein designated VGAM is inhibition of expression of VGAM2574 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2574 correlate with, and may be deduced from, the identity of the target genes which VGAM2574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87070] Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome

Region, Candidate 3 (ALS2CR3, Accession NM_015049) is a VGAM2574 host target gene. ALS2CR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALS2CR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:17409, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87071] A function of VGAM2574 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM_015049). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3. KIAA0555 (Accession NM_014790) is another VGAM2574 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ

ID:16681, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87072] Another function of VGAM2574 is therefore inhibition of KIAA0555 (Accession NM_014790). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. KIAA0979 (Accession NM_015032) is another VGAM2574 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:17388, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87073] Another function of VGAM2574 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. SBBI26 (Accession NM_018846) is another VGAM2574 host target gene. SBBI26 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SBBI26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI26 BINDING SITE, designated SEQ ID:20830, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87074] Another function of VGAM2574 is therefore inhibition of SBBI26 (Accession NM_018846). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI26. LOC120892 (Accession XM_058513) is another VGAM2574 host target gene. LOC120892 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120892 BINDING SITE, designated SEQ ID:36647, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87075] Another function of VGAM2574 is therefore inhibition of

LOC120892 (Accession XM_058513). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120892. LOC149734 (Accession XM_097713) is another VGAM2574 host target gene. LOC149734 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149734 BINDING SITE, designated SEQ ID:41055, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87076] Another function of VGAM2574 is therefore inhibition of LOC149734 (Accession XM_097713). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149734. LOC152687 (Accession XM_087503) is another VGAM2574 host target gene. LOC152687 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC152687 BINDING SITE, designated SEQ ID:39301, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87077] Another function of VGAM2574 is therefore inhibition of LOC152687 (Accession XM_087503). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152687. LOC166793 (Accession NM_145291) is another VGAM2574 host target gene. LOC166793 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166793 BINDING SITE, designated SEQ ID:29805, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87078] Another function of VGAM2574 is therefore inhibition of LOC166793 (Accession NM_145291). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166793. LOC168391 (Accession XM_095061) is an-

other VGAM2574 host target gene. LOC168391 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC168391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168391 BINDING SITE, designated SEQ ID:40242, to the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, also designated SEQ ID:5285.

[87079] Another function of VGAM2574 is therefore inhibition of LOC168391 (Accession XM_095061). Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2575 (VGAM2575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87080] VGAM2575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2575 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[87081] VGAM2575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87082] VGAM2575 gene encodes a VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2575 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2575 precursor RNA is designated SEQ ID:2561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2561 is located at position 4661 relative to the genome of Triatoma Virus.

[87083] VGAM2575 precursor RNA folds onto itself, forming VGAM2575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87084] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2575 folded precursor RNA into VGAM2575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2575 RNA is designated SEQ ID:5286, and is provided hereinbelow with reference to the sequence listing part.

[87085] VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2575 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87086] VGAM2575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2575 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87087] The complementary binding of VGAM2575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2575 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2575 host target RNA into VGAM2575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87088] It is appreciated that VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2575 host target genes. The mRNA of each one of this plurality of VGAM2575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2575 RNA, herein designated VGAM RNA, and which when bound by VGAM2575 RNA causes inhibition of translation of respective one or more VGAM2575 host target proteins.

[87089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2575 gene, herein designated VGAM GENE, on one or more VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87090] It is yet further appreciated that a function of VGAM2575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2575 correlate with, and may be deduced from, the identity of the host target genes which VGAM2575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87091] Nucleotide sequences of the VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2575 are further described hereinbelow with reference to Table 1.

[87092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2575 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2575 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87093] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2575 gene, herein designated VGAM is inhibition of expression of VGAM2575 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2575 correlate with, and may be deduced from, the identity of the target genes which VGAM2575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87094] Ellis Van Creveld Syndrome (EVC, Accession NM_014556) is a VGAM2575 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15897, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87095] A function of VGAM2575 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM_014556). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM2575 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9574, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87096] Another function of VGAM2575 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and

cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666) is another VGAM2575 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:27393, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87097] Another function of VGAM2575 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666), a gene which acts as a fibronectin receptor.

Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM427.Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_139125) is another VGAM2575 host target gene. MASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:29161, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87098] Another function of VGAM2575 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_139125), a gene which a complement-dependent bactericidal factor . Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MASP1. The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM566.Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960) is another VGAM2575 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:22491, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87099] Another function of VGAM2575 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960), a gene which involved in programing of differentiation and concomitant maintenance of viability. Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM1083.Sp3 Transcription Factor (SP3, Accession XM_092672) is another VGAM2575 host target gene. SP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP3 BINDING SITE, designated SEQ ID:40137, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87100] Another function of VGAM2575 is therefore inhibition of Sp3 Transcription Factor (SP3, Accession XM_092672), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP3. The function of SP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM861.Zinc Finger Protein 180 (HHZ168) (ZNF180, Accession NM_013256) is another VGAM2575 host target gene. ZNF180 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF180 BINDING SITE, designated SEQ ID:14925, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87101] Another function of VGAM2575 is therefore inhibition of Zinc Finger Protein 180 (HHZ168) (ZNF180, Accession NM_013256). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF180. Zinc Finger Protein 192 (ZNF192, Accession NM_006298) is another VGAM2575 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12989, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87102] Another function of VGAM2575 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM_006298). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2575 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44783, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87103] Another function of VGAM2575 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. C3IP1 (Accession NM_021633) is another VGAM2575 host target gene. C3IP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

C3IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3IP1 BINDING SITE, designated SEQ ID:22277, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87104] Another function of VGAM2575 is therefore inhibition of C3IP1 (Accession NM_021633). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3IP1. Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM_133367) is another VGAM2575 host target gene. C6orf33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:28492, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87105] Another function of VGAM2575 is therefore inhibition of Chromosome 6 Open Reading Frame 33 (C6orf33, Acces-

sion NM_133367). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33. CDC14 Cell Division Cycle 14 Homolog A (S. cerevisiae) (CDC14A, Accession NM_003672) is another VGAM2575 host target gene. CDC14A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14A BINDING SITE, designated SEQ ID:9767, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87106] Another function of VGAM2575 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog A (S. cerevisiae) (CDC14A, Accession NM_003672). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A. DKFZP434L187 (Accession XM_044070) is another VGAM2575 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34126, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87107] Another function of VGAM2575 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ00001 (Accession XM_088525) is another VGAM2575 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39786, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87108] Another function of VGAM2575 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of

VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ13081 (Accession NM_024834) is another VGAM2575 host target gene. FLJ13081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13081 BINDING SITE, designated SEQ ID:24239, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87109] Another function of VGAM2575 is therefore inhibition of FLJ13081 (Accession NM_024834). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13081. FLJ13614 (Accession NM_139076) is another VGAM2575 host target gene. FLJ13614 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13614

BINDING SITE, designated SEQ ID:29151, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87110] Another function of VGAM2575 is therefore inhibition of FLJ13614 (Accession NM_139076). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13614. FLJ13693 (Accession NM_024807) is another VGAM2575 host target gene. FLJ13693 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13693 BINDING SITE, designated SEQ ID:24187, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87111] Another function of VGAM2575 is therefore inhibition of FLJ13693 (Accession NM_024807). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13693. FLJ20232 (Accession NM_019008) is another VGAM2575 host target gene. FLJ20232 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21082, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87112] Another function of VGAM2575 is therefore inhibition of FLJ20232 (Accession NM_019008). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. HEMK (Accession NM_016173) is another VGAM2575 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18272, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87113] Another function of VGAM2575 is therefore inhibition of

HEMK (Accession NM_016173). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. HSA249128 (Accession NM_017583) is another VGAM2575 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19029, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87114] Another function of VGAM2575 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA0172 (Accession XM_036295) is another VGAM2575 host target gene. KIAA0172 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0172 BINDING SITE, designated SEQ ID:32412, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87115] Another function of VGAM2575 is therefore inhibition of KIAA0172 (Accession XM_036295). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0172. KIAA0247 (Accession NM_014734) is another VGAM2575 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16381, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87116] Another function of VGAM2575 is therefore inhibition of KIAA0247 (Accession NM_014734). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA1034 (Accession XM_031223) is another

VGAM2575 host target gene. KIAA1034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1034 BINDING SITE, designated SEQ ID:31314, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87117] Another function of VGAM2575 is therefore inhibition of KIAA1034 (Accession XM_031223). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1034. KIAA1061 (Accession XM_048786) is another VGAM2575 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35270, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87118] Another function of VGAM2575 is therefore inhibition of KIAA1061 (Accession XM_048786). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. KIAA1877 (Accession XM_038616) is another VGAM2575 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32881, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87119] Another function of VGAM2575 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. KIAA1946 (Accession XM_092459) is another VGAM2575 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:40120, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87120] Another function of VGAM2575 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946. LIN-28 (Accession NM_024674) is another VGAM2575 host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BINDING SITE, designated SEQ ID:23983, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87121] Another function of VGAM2575 is therefore inhibition of LIN-28 (Accession NM_024674). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28.

Mitochondrial Ribosomal Protein S35 (MRPS35, Accession NM_021821) is another VGAM2575 host target gene. MRPS35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPS35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS35 BINDING SITE, designated SEQ ID:22399, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87122] Another function of VGAM2575 is therefore inhibition of Mitochondrial Ribosomal Protein S35 (MRPS35, Accession NM_021821). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS35. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2575 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30779, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87123] Another function of VGAM2575 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. PRO0097 (Accession NM_014114) is another VGAM2575 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15366, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87124] Another function of VGAM2575 is therefore inhibition of PRO0097 (Accession NM_014114). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO0097. LOC144871 (Accession XM_096698) is another VGAM2575 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40473, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87125] Another function of VGAM2575 is therefore inhibition of LOC144871 (Accession XM_096698). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC147495 (Accession XM_097240) is another VGAM2575 host target gene. LOC147495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147495 BINDING SITE, designated SEQ ID:40841, to the nucleotide sequence of VGAM2575 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5286.

[87126] Another function of VGAM2575 is therefore inhibition of LOC147495 (Accession XM_097240). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147495. LOC149332 (Accession XM_097626) is another VGAM2575 host target gene. LOC149332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149332 BINDING SITE, designated SEQ ID:40982, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87127] Another function of VGAM2575 is therefore inhibition of LOC149332 (Accession XM_097626). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149332. LOC149837 (Accession XM_097747) is another VGAM2575 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149837, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41101, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87128] Another function of VGAM2575 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC153027 (Accession XM_041221) is another VGAM2575 host target gene. LOC153027 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153027 BINDING SITE, designated SEQ ID:33490, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87129] Another function of VGAM2575 is therefore inhibition of LOC153027 (Accession XM_041221). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153027. LOC255862 (Accession XM_170505) is another VGAM2575 host target gene. LOC255862 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255862 BINDING SITE, designated SEQ ID:45342, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87130] Another function of VGAM2575 is therefore inhibition of LOC255862 (Accession XM_170505). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255862. LOC257471 (Accession XM_171020) is another VGAM2575 host target gene. LOC257471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257471 BINDING SITE, designated SEQ ID:45789, to

the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87131] Another function of VGAM2575 is therefore inhibition of LOC257471 (Accession XM_171020). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257471. LOC51097 (Accession NM_016002) is another VGAM2575 host target gene. LOC51097 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51097 BINDING SITE, designated SEQ ID:18090, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87132] Another function of VGAM2575 is therefore inhibition of LOC51097 (Accession NM_016002). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51097. LOC56965 (Accession NM_020213) is another VGAM2575 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21455, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87133] Another function of VGAM2575 is therefore inhibition of LOC56965 (Accession NM_020213). Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. LOC91397 (Accession XM_038219) is another VGAM2575 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32783, to the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, also designated SEQ ID:5286.

[87134] Another function of VGAM2575 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities

of VGAM2575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2576 (VGAM2576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87135] VGAM2576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2576 was detected is described hereinabove with reference to Figs. 1-8.

[87136] VGAM2576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87137] VGAM2576 gene encodes a VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2576 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2576 precursor RNA is designated SEQ ID:2562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2562 is located at position 5068 relative to the genome of Triatoma Virus.

[87138] VGAM2576 precursor RNA folds onto itself, forming VGAM2576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87139] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2576 folded precursor RNA into VGAM2576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2576 RNA is designated SEQ ID:5287, and

is provided hereinbelow with reference to the sequence listing part.

[87140] VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2576 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87141] VGAM2576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2576 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87142] The complementary binding of VGAM2576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2576 host target RNA into VGAM2576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87143] It is appreciated that VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2576 host target genes. The mRNA of each one of this plurality of VGAM2576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2576 RNA, herein designated VGAM RNA, and which when bound by VGAM2576 RNA causes inhibition of translation of respective one or more VGAM2576 host target proteins.

[87144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2576 gene, herein designated VGAM GENE, on one or more VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87145] It is yet further appreciated that a function of VGAM2576 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2576 correlate with, and may be deduced from, the identity of the host target genes which VGAM2576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87146] Nucleotide sequences of the VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2576 are further described hereinbelow with reference to Table 1.

[87147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2576 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87148] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2576 gene, herein designated VGAM is inhibition of expression of VGAM2576 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2576 correlate with, and may be deduced from, the identity of the target genes which VGAM2576 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87149] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM2576 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7595, to the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87150] A function of VGAM2576 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM2576 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is another VGAM2576 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42718, to the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87151] Another function of VGAM2576 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established

by previous studies, as described hereinabove with reference to VGAM120.CRIPT (Accession XM_057669) is another VGAM2576 host target gene. CRIPT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIPT BINDING SITE, designated SEQ ID:36538, to the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87152] Another function of VGAM2576 is therefore inhibition of CRIPT (Accession XM_057669). Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIPT. H_GS165L15.1 (Accession NM_004904) is another VGAM2576 host target gene. H_GS165L15.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H_GS165L15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H_GS165L15.1 BINDING SITE, designated SEQ ID:11337, to

the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87153] Another function of VGAM2576 is therefore inhibition of H_GS165L15.1 (Accession NM_004904). Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H_GS165L15.1. NS1-BP (Accession XM_051877) is another VGAM2576 host target gene. NS1-BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NS1-BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NS1-BP BINDING SITE, designated SEQ ID:35912, to the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87154] Another function of VGAM2576 is therefore inhibition of NS1-BP (Accession XM_051877). Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NS1-BP. Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168) is another VGAM2576 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ ID:29176, to the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, also designated SEQ ID:5287.

[87155] Another function of VGAM2576 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168). Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2577 (VGAM2577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87156] VGAM2577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2577 was detected is described hereinabove with reference to Figs. 1-8.

[87157] VGAM2577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87158] VGAM2577 gene encodes a VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2577 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2577 precursor RNA is designated SEQ ID:2563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2563 is located at position 985 relative to the genome of Triatoma Virus.

[87159] VGAM2577 precursor RNA folds onto itself, forming VGAM2577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[87160] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2577 folded precursor RNA into VGAM2577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM2577 RNA is designated SEQ ID:5288, and is provided hereinbelow with reference to the sequence listing part.

[87161] VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2577 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87162] VGAM2577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2577 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2577 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87163] The complementary binding of VGAM2577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2577 host target RNA into VGAM2577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87164] It is appreciated that VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2577 host target genes. The mRNA of each one of this plurality of VGAM2577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2577 RNA, herein designated VGAM RNA, and which when bound by VGAM2577 RNA causes inhibition of translation of respective one or more VGAM2577 host target proteins.

[87165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2577 gene, herein designated VGAM GENE, on one or more VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87166] It is yet further appreciated that a function of VGAM2577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2577 correlate with, and may be deduced from, the identity of the host target genes which VGAM2577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87167] Nucleotide sequences of the VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2577 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2577 are further described hereinbelow with reference to Table 1.

[87168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2577 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87169] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2577 gene, herein designated VGAM is inhibition of expression of VGAM2577 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2577 correlate with, and may be deduced from, the identity of the target genes which VGAM2577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87170] DQX1 (Accession NM_133637) is a VGAM2577 host target gene. DQX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DQX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DQX1 BINDING SITE, designated SEQ ID:28597, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87171] A function of VGAM2577 is therefore inhibition of DQX1 (Accession NM_133637). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DQX1. FLJ11608 (Accession NM_024557) is another VGAM2577 host target gene. FLJ11608 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11608 BINDING SITE, designated SEQ ID:23777, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87172] Another function of VGAM2577 is therefore inhibition of FLJ11608 (Accession NM_024557). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11608. FLJ13263 (Accession NM_025125) is another VGAM2577 host target gene. FLJ13263 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13263 BINDING SITE, designated SEQ ID:24769, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87173] Another function of VGAM2577 is therefore inhibition of FLJ13263 (Accession NM_025125). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13263. ICB-1 (Accession NM_004848) is another VGAM2577 host target gene. ICB-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICB-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICB-1 BINDING SITE, designated SEQ ID:11259, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87174] Another function of VGAM2577 is therefore inhibition of

ICB-1 (Accession NM_004848). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICB-1. Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM_006290) is another VGAM2577 host target gene. TNFAIP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFAIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP3 BINDING SITE, designated SEQ ID:12978, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87175] Another function of VGAM2577 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM_006290). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TN-FAIP3. LOC130813 (Accession XM_065904) is another VGAM2577 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37307, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87176] Another function of VGAM2577 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC145828 (Accession XM_096879) is another VGAM2577 host target gene. LOC145828 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145828 BINDING SITE, designated SEQ ID:40611, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87177] Another function of VGAM2577 is therefore inhibition of LOC145828 (Accession XM_096879). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145828. LOC151996 (Accession XM_098151) is another VGAM2577 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41412, to the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, also designated SEQ ID:5288.

[87178] Another function of VGAM2577 is therefore inhibition of LOC151996 (Accession XM_098151). Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2578 (VGAM2578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87179] VGAM2578 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2578 was detected is described hereinabove with reference to Figs. 1-8.

[87180] VGAM2578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87181] VGAM2578 gene encodes a VGAM2578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2578 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2578 precursor RNA is designated SEQ ID:2564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2564 is located at position 849 relative to the genome of Triatoma Virus.

[87182] VGAM2578 precursor RNA folds onto itself, forming VGAM2578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87183] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2578 folded precursor RNA into VGAM2578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2578 RNA is designated SEQ ID:5289, and is provided hereinbelow with reference to the sequence listing part.

[87184] VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2578 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87185] VGAM2578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2578 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2578 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87186] The complementary binding of VGAM2578 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2578 host target RNA into VGAM2578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87187] It is appreciated that VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2578 host target genes. The mRNA of each one of this plurality of VGAM2578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2578 RNA, herein designated VGAM RNA, and which when bound by VGAM2578 RNA causes inhibition of translation of respective one or more VGAM2578 host target proteins.

[87188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2578 gene, herein designated VGAM GENE, on one or more VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87189] It is yet further appreciated that a function of VGAM2578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2578 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2578 correlate with, and may be deduced from, the identity of the host target genes which VGAM2578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87190] Nucleotide sequences of the VGAM2578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2578 are further described hereinbelow with reference to Table 1.

[87191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2578 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87192] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2578 gene, herein designated VGAM is inhibition of expression of VGAM2578 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2578 correlate with, and may be deduced from, the identity of the target genes which VGAM2578 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87193] Carbonic Anhydrase XII (CA12, Accession NM_001218) is a VGAM2578 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:6878, to the nucleotide sequence of VGAM2578 RNA, herein designated VGAM RNA, also designated SEQ ID:5289.

[87194] A function of VGAM2578 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM2578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2579 (VGAM2579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87195] VGAM2579 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2579 was detected is described hereinabove with reference to Figs. 1-8.

[87196] VGAM2579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87197] VGAM2579 gene encodes a VGAM2579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2579 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2579 precursor RNA is designated SEQ ID:2565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2565 is located at position 7412 relative to the genome of Triatoma Virus.

[87198] VGAM2579 precursor RNA folds onto itself, forming VGAM2579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87199] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2579 folded precursor RNA into VGAM2579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2579 RNA is designated SEQ ID:5290, and is provided hereinbelow with reference to the sequence listing part.

[87200] VGAM2579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2579 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87201] VGAM2579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2579 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2579 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2579 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87202] The complementary binding of VGAM2579 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2579 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2579 host target RNA into VGAM2579 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87203] It is appreciated that VGAM2579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2579 host target genes. The mRNA of each one of this plurality of VGAM2579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2579 RNA, herein designated VGAM RNA, and which when bound by VGAM2579 RNA causes inhibition of translation of respective one or more VGAM2579 host target proteins.

[87204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2579 gene, herein designated VGAM GENE, on one or more VGAM2579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87205] It is yet further appreciated that a function of VGAM2579 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2579 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2579 correlate with, and may be deduced from, the identity of the host target genes which VGAM2579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87206] Nucleotide sequences of the VGAM2579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2579 are further described hereinbelow with reference to Table 1.

[87207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2579 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87208] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2579 gene, herein designated VGAM is inhibition of expression of VGAM2579 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2579 correlate with, and may be deduced from, the identity of the target genes which VGAM2579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87209] DXF68S1E (Accession XM_010289) is a VGAM2579 host target gene. DXF68S1E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by DXF68S1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXF68S1E BINDING SITE, designated SEQ ID:30152, to the nucleotide sequence of VGAM2579 RNA, herein designated VGAM RNA, also designated SEQ ID:5290.

[87210] A function of VGAM2579 is therefore inhibition of DXF68S1E (Accession XM_010289). Accordingly, utilities of VGAM2579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXF68S1E. Junctional Adhesion Molecule 1 (JAM1, Accession NM_016946) is another VGAM2579 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 through JAM1 BINDING SITE4, designated SEQ ID:18862, SEQ ID:29329, SEQ ID:29340 and SEQ ID:29350 respectively, to the nucleotide sequence of VGAM2579 RNA, herein designated VGAM RNA, also designated SEQ

ID:5290.

[87211] Another function of VGAM2579 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_016946). Accordingly, utilities of VGAM2579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2580 (VGAM2580) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87212] VGAM2580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2580 was detected is described hereinabove with reference to Figs. 1-8.

[87213] VGAM2580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87214] VGAM2580 gene encodes a VGAM2580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2580 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2580 precursor RNA is designated SEQ ID:2566, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2566 is located at position 7916 relative to the genome of Triatoma Virus.

[87215] VGAM2580 precursor RNA folds onto itself, forming VGAM2580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2580 folded precursor RNA into VGAM2580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2580 RNA is designated SEQ ID:5291, and is provided hereinbelow with reference to the sequence listing part.

[87217] VGAM2580 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2580 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2580 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87218] VGAM2580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2580 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2580 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2580 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87219] The complementary binding of VGAM2580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2580 host target RNA into VGAM2580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87220] It is appreciated that VGAM2580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2580 host target genes. The mRNA of

each one of this plurality of VGAM2580 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2580 RNA, herein designated VGAM RNA, and which when bound by VGAM2580 RNA causes inhibition of translation of respective one or more VGAM2580 host target proteins.

[87221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2580 gene, herein designated VGAM GENE, on one or more VGAM2580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[87222] It is yet further appreciated that a function of VGAM2580 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2580 correlate with, and may be deduced from, the identity of the host target genes which VGAM2580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87223] Nucleotide sequences of the VGAM2580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2580 are further described hereinbelow with reference to Table 1.

[87224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2580 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2580 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2580 gene, herein designated VGAM is inhibition of expression of VGAM2580 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2580 correlate with, and may be deduced from, the identity of the target genes which VGAM2580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87226] Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is a VGAM2580 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14879, to the nucleotide sequence of VGAM2580 RNA, herein designated VGAM RNA, also designated SEQ ID:5291.

[87227] A function of VGAM2580 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2,

Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351) is another VGAM2580 host target gene. STS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STS BINDING SITE, designated SEQ ID:5907, to the nucleotide sequence of VGAM2580 RNA, herein designated VGAM RNA, also designated SEQ ID:5291.

[87228] Another function of VGAM2580 is therefore inhibition of Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351). Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STS.

Thyrotropin-releasing Hormone (TRH, Accession NM_007117) is another VGAM2580 host target gene. TRH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRH BINDING SITE, designated SEQ ID:13979, to the nucleotide sequence of VGAM2580 RNA, herein designated VGAM RNA, also designated SEQ ID:5291.

[87229] Another function of VGAM2580 is therefore inhibition of Thyrotropin-releasing Hormone (TRH, Accession NM_007117), a gene which functions as a regulator of the biosynthesis of tsh in the anterior pituitary gland and as a neurotransmitter/ neuromodulator in the central and peripheral nervous systems. Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRH. The function of TRH has been established by previous studies. Thyrotropin-releasing hormone (TRH), the major hypothalamic mediator of release of thyroid-stimulating hormone (TSHB; 188540), is a tripeptide (glu-his-pro) found in highest concentrations in the medial division of

the hypothalamic paraventricular nuclei and in the median eminence. TRH stimulates the release of prolactin as well as that of TSH. The prolactin response is enhanced in hypothyroidism and diminished in hyperthyroidism. Niimi et al. (1982) reported a girl with isolated TRH deficiency. The parents were unrelated. She was seen at age 4 years for short stature. The authors suggested that TRH-synthesizing enzyme in the hypothalamus (Mitnick and Reichlin, 1972) may be deficient. It is now known that TRH is a peptide synthesized as such. Katakami et al. (1984) described an 18-year-old girl with isolated TRH deficiency and suggested that hypothyroidism in this patient was due to dysfunction of hypothalamic TRH release. Foresti and Ferrari (1985) suggested that resistance of pituitary thyrotropes (TSH-producing pituitary cells) due to a receptor defect is a more likely explanation, and that direct serum determination of TRH is a valid way to diagnose TRH deficiency. Yamada et al. (1990) reported that the transcriptional unit of prepro-TRH is 3.3 kb long, with 3 exons interrupted by 2 introns of approximately 1,050 and 650 basepairs, respectively. The predicted human prepro-TRH has 242 amino acids.

[87230] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[87231] Niimi, H.; Inomata, H.; Sasaki, N.; Nakajima, H. : Congenital isolated thyrotrophin releasing hormone deficiency. Arch. Dis. Child. 57: 877-878, 1982. ; and

[87232] Foresti, V.; Ferrari, C. : Central hypothyroidism: isolated thyrotropin-releasing hormone deficiency or resistance of pituitary thyrotropes?. (Letter) J. Endocr. Invest. 8: 577 only, 19.

[87233] Further studies establishing the function and utilities of TRH are found in John Hopkins OMIM database record ID 275120, and in sited publications numbered 7236-7237, 658 and 7238-7242 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.LOC84549 (Accession NM_032509) is another VGAM2580 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26258, to the nucleotide sequence of VGAM2580 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5291.

[87234] Another function of VGAM2580 is therefore inhibition of LOC84549 (Accession NM_032509). Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. LOC90538 (Accession XM_032401) is another VGAM2580 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90538 BINDING SITE, designated SEQ ID:31654, to the nucleotide sequence of VGAM2580 RNA, herein designated VGAM RNA, also designated SEQ ID:5291.

[87235] Another function of VGAM2580 is therefore inhibition of LOC90538 (Accession XM_032401). Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. LOC92935 (Accession XM_048197) is another VGAM2580 host target gene. LOC92935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92935, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92935 BINDING SITE, designated SEQ ID:35131, to the nucleotide sequence of VGAM2580 RNA, herein designated VGAM RNA, also designated SEQ ID:5291.

[87236] Another function of VGAM2580 is therefore inhibition of LOC92935 (Accession XM_048197). Accordingly, utilities of VGAM2580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92935. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2581 (VGAM2581) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87237] VGAM2581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2581 was detected is described hereinabove with reference to Figs. 1-8.

[87238] VGAM2581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus.

VGAM2581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87239] VGAM2581 gene encodes a VGAM2581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2581 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2581 precursor RNA is designated SEQ ID:2567, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2567 is located at position 6465 relative to the genome of Triatoma Virus.

[87240] VGAM2581 precursor RNA folds onto itself, forming VGAM2581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87241] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2581 folded precursor RNA into VGAM2581 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2581 RNA is designated SEQ ID:5292, and is provided hereinbelow with reference to the sequence listing part.

[87242] VGAM2581 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2581 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2581 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87243] VGAM2581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2581 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2581 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87244] The complementary binding of VGAM2581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2581 host target RNA into VGAM2581 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87245] It is appreciated that VGAM2581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2581 host target genes. The mRNA of each one of this plurality of VGAM2581 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2581 RNA, herein designated VGAM RNA, and which when bound by VGAM2581 RNA causes inhibition of translation of respective one or more VGAM2581 host target proteins.

[87246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2581 gene, herein designated VGAM GENE, on one or more VGAM2581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87247] It is yet further appreciated that a function of VGAM2581 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2581 correlate with, and may be deduced from, the identity of the host target genes which VGAM2581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87248] Nucleotide sequences of the VGAM2581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2581 are further described hereinbelow with reference to Table 1.

[87249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2581 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2581 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2581 gene, herein designated VGAM is inhibition of expression of VGAM2581 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2581 correlate with, and may be deduced from, the identity of the target genes which VGAM2581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87251] Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_004458) is a VGAM2581 host target gene. FACL4 BINDING SITE1 and FACL4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FACL4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE1 and

FACL4 BINDING SITE2, designated SEQ ID:10760 and SEQ ID:23250 respectively, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87252] A function of VGAM2581 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_004458). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4. Ketohexokinase (fructokinase) (KHK, Accession NM_000221) is another VGAM2581 host target gene. KHK BINDING SITE1 and KHK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KHK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHK BINDING SITE1 and KHK BINDING SITE2, designated SEQ ID:5730 and SEQ ID:37563 respectively, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87253] Another function of VGAM2581 is therefore inhibition of Ketohexokinase (fructokinase) (KHK, Accession NM_000221). Accordingly, utilities of VGAM2581 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KHK. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020473) is another VGAM2581 host target gene. PIGA BINDING SITE1 and PIGA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 and PIGA BINDING SITE2, designated SEQ ID:21716 and SEQ ID:8866 respectively, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87254] Another function of VGAM2581 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020473). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NM_003032) is another VGAM2581 host target gene. SIAT1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by SIAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:8975, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87255] Another function of VGAM2581 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NM_003032), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1. The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.Claudin 1 (CLDN1, Accession NM_021101) is another VGAM2581 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22078, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87256] Another function of VGAM2581 is therefore inhibition of Claudin 1 (CLDN1, Accession NM_021101). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. KIAA0426 (Accession NM_014724) is another VGAM2581 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16306, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87257] Another function of VGAM2581 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0426. KIAA1255 (Accession XM_040626) is another VGAM2581 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:33345, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87258] Another function of VGAM2581 is therefore inhibition of KIAA1255 (Accession XM_040626). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1255. KIAA1712 (Accession XM_041497) is another VGAM2581 host target gene. KIAA1712 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33537, to the nucleotide sequence of VGAM2581 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5292.

[87259] Another function of VGAM2581 is therefore inhibition of KIAA1712 (Accession XM_041497). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. MEGF10 (Accession NM_032446) is another VGAM2581 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26213, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87260] Another function of VGAM2581 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. SCAN Domain Containing 2 (SCAND2, Accession NM_022050) is another VGAM2581 host target gene. SCAND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SCAND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAND2 BINDING SITE, designated SEQ ID:22576, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87261] Another function of VGAM2581 is therefore inhibition of SCAN Domain Containing 2 (SCAND2, Accession NM_022050). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAND2. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM_015975) is another VGAM2581 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18071, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87262] Another function of VGAM2581 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM_015975). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820) is another VGAM2581 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16788, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87263] Another function of VGAM2581 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. UQCR (Accession NM_006830)

is another VGAM2581 host target gene. UQCR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UQCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UQCR BINDING SITE, designated SEQ ID:13708, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87264] Another function of VGAM2581 is therefore inhibition of UQCR (Accession NM_006830). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UQCR. LOC120939 (Accession XM_073688) is another VGAM2581 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37512, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87265] Another function of VGAM2581 is therefore inhibition of LOC120939 (Accession XM_073688). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC128338 (Accession XM_059238) is another VGAM2581 host target gene. LOC128338 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128338 BINDING SITE, designated SEQ ID:36925, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87266] Another function of VGAM2581 is therefore inhibition of LOC128338 (Accession XM_059238). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128338. LOC144845 (Accession NM_138474) is another VGAM2581 host target gene. LOC144845 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144845, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144845 BINDING SITE, designated SEQ ID:28822, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87267] Another function of VGAM2581 is therefore inhibition of LOC144845 (Accession NM_138474). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144845. LOC146780 (Accession XM_097086) is another VGAM2581 host target gene. LOC146780 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146780, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146780 BINDING SITE, designated SEQ ID:40744, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87268] Another function of VGAM2581 is therefore inhibition of LOC146780 (Accession XM_097086). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146780. LOC147804 (Accession XM_085901) is another VGAM2581 host target gene. LOC147804 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147804 BINDING SITE, designated SEQ ID:38381, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87269] Another function of VGAM2581 is therefore inhibition of LOC147804 (Accession XM_085901). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147804. LOC150998 (Accession XM_097990) is another VGAM2581 host target gene. LOC150998 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150998, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150998 BINDING SITE, designated SEQ ID:41285, to the nucleotide sequence of VGAM2581 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5292.

[87270] Another function of VGAM2581 is therefore inhibition of LOC150998 (Accession XM_097990). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150998. LOC151318 (Accession XM_087170) is another VGAM2581 host target gene. LOC151318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151318 BINDING SITE, designated SEQ ID:39104, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87271] Another function of VGAM2581 is therefore inhibition of LOC151318 (Accession XM_087170). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151318. LOC255481 (Accession XM_170489) is another VGAM2581 host target gene. LOC255481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255481, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255481 BINDING SITE, designated SEQ ID:45329, to the nucleotide sequence of VGAM2581 RNA, herein designated VGAM RNA, also designated SEQ ID:5292.

[87272] Another function of VGAM2581 is therefore inhibition of LOC255481 (Accession XM_170489). Accordingly, utilities of VGAM2581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255481. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2582 (VGAM2582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87273] VGAM2582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2582 was detected is described hereinabove with reference to Figs. 1-8.

[87274] VGAM2582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus.

VGAM2582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87275] VGAM2582 gene encodes a VGAM2582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2582 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2582 precursor RNA is designated SEQ ID:2568, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2568 is located at position 8016 relative to the genome of Triatoma Virus.

[87276] VGAM2582 precursor RNA folds onto itself, forming VGAM2582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87277] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2582 folded precursor RNA into VGAM2582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2582 RNA is designated SEQ ID:5293, and is provided hereinbelow with reference to the sequence listing part.

[87278] VGAM2582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2582 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2582 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87279] VGAM2582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2582 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87280] The complementary binding of VGAM2582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2582 host target RNA into VGAM2582 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87281] It is appreciated that VGAM2582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2582 host target genes. The mRNA of each one of this plurality of VGAM2582 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2582 RNA, herein designated VGAM RNA, and which when bound by VGAM2582 RNA causes inhibition of translation of respective one or more VGAM2582 host target proteins.

[87282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2582 gene, herein designated VGAM GENE, on one or more VGAM2582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87283] It is yet further appreciated that a function of VGAM2582 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2582 correlate with, and may be deduced from, the identity of the host target genes which VGAM2582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87284] Nucleotide sequences of the VGAM2582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2582 are further described hereinbelow with reference to Table 1.

[87285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2582 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2582 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87286] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2582 gene, herein designated VGAM is inhibition of expression of VGAM2582 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2582 correlate with, and may be deduced from, the identity of the target genes which VGAM2582 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87287] Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is a VGAM2582 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28040, to the nu-

cleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87288] A function of VGAM2582 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795) is another VGAM2582 host target gene. EIF3S10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF3S10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S10 BINDING SITE, designated SEQ ID:35500, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ

ID:5293.

[87289] Another function of VGAM2582 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795), a gene which binds to the 40s ribosome and promotes the binding of methionyl-trnai and mrna. Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S10. The function of EIF3S10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM882.Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM_042167) is another VGAM2582 host target gene. FUT9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT9 BINDING SITE, designated SEQ ID:33699, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87290] Another function of VGAM2582 is therefore inhibition of

Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM_042167), a gene which catalyzes alpha-1,3 glycosidic linkages. Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT9. The function of FUT9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622) is another VGAM2582 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOH11CR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15985, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87291] Another function of VGAM2582 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622). Accordingly, utilities of VGAM2582 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with LOH11CR2A. Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130834) is another VGAM2582 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28331, SEQ ID:28355, SEQ ID:28339, SEQ ID:28323 and SEQ ID:28347 respectively, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87292] Another function of VGAM2582 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130834). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788) is another VGAM2582 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE4A,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11196, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87293] Another function of VGAM2582 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4A. The function of UBE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.FLJ10803 (Accession NM_018224) is another VGAM2582 host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20156, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87294] Another function of VGAM2582 is therefore inhibition of FLJ10803 (Accession NM_018224). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. KIAA0553 (Accession XM_045981) is another VGAM2582 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE, designated SEQ ID:34633, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87295] Another function of VGAM2582 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0553. KIAA0924 (Accession NM_014897) is another VGAM2582 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17062, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87296] Another function of VGAM2582 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1266 (Accession XM_038567) is another VGAM2582 host target gene. KIAA1266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1266 BINDING SITE, designated SEQ ID:32867, to the nucleotide sequence of VGAM2582 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5293.

[87297] Another function of VGAM2582 is therefore inhibition of KIAA1266 (Accession XM_038567). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1266. KIAA1328 (Accession XM_029429) is another VGAM2582 host target gene. KIAA1328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1328 BINDING SITE, designated SEQ ID:30889, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87298] Another function of VGAM2582 is therefore inhibition of KIAA1328 (Accession XM_029429). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1328. KIAA1554 (Accession XM_170834) is another VGAM2582 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45606, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87299] Another function of VGAM2582 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. SKIP (Accession NM_130766) is another VGAM2582 host target gene. SKIP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SKIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING SITE, designated SEQ ID:28263, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87300] Another function of VGAM2582 is therefore inhibition of SKIP (Accession NM_130766). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SKIP. LOC118668 (Accession XM_061081) is another VGAM2582 host target gene. LOC118668 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118668 BINDING SITE, designated SEQ ID:37190, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87301] Another function of VGAM2582 is therefore inhibition of LOC118668 (Accession XM_061081). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118668. LOC151318 (Accession XM_087170) is another VGAM2582 host target gene. LOC151318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151318 BINDING SITE, designated SEQ ID:39106, to

the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87302] Another function of VGAM2582 is therefore inhibition of LOC151318 (Accession XM_087170). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151318. LOC91115 (Accession XM_036218) is another VGAM2582 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32401, to the nucleotide sequence of VGAM2582 RNA, herein designated VGAM RNA, also designated SEQ ID:5293.

[87303] Another function of VGAM2582 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM2582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2583 (VGAM2583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87304] VGAM2583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2583 was detected is described hereinabove with reference to Figs. 1-8.

[87305] VGAM2583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM2583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87306] VGAM2583 gene encodes a VGAM2583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2583 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2583 precursor RNA is designated SEQ ID:2569, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2569 is located at position 7137 relative to the genome of Triatoma Virus.

[87307] VGAM2583 precursor RNA folds onto itself, forming VGAM2583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87308] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2583 folded precursor RNA into VGAM2583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2583 RNA is designated SEQ ID:5294, and is provided hereinbelow with reference to the sequence listing part.

[87309] VGAM2583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2583 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2583 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87310] VGAM2583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2583 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87311] The complementary binding of VGAM2583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2583 host target RNA into VGAM2583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87312] It is appreciated that VGAM2583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2583 host target genes. The mRNA of each one of this plurality of VGAM2583 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2583 RNA, herein designated VGAM RNA, and which when bound by VGAM2583 RNA causes inhibition of translation of respective one or more VGAM2583 host target proteins.

[87313] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2583 gene, herein designated VGAM GENE, on one or more VGAM2583 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87314] It is yet further appreciated that a function of VGAM2583 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM2583 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2583 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87315] Nucleotide sequences of the VGAM2583 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2583 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2583 are further described hereinbelow with reference to Table 1.

[87316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2583 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2583 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87317] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2583 gene, herein designated VGAM is inhibition of expression of VGAM2583 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2583 correlate with, and may be deduced from, the identity of the target genes which VGAM2583

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87318] Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492) is a VGAM2583 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CFTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:6100, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87319] A function of VGAM2583 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317) is another VGAM2583 host target gene. LDOC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LDOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDOC1 BINDING SITE, designated SEQ ID:14694, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87320] Another function of VGAM2583 is therefore inhibition of Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDOC1. POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is another VGAM2583 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12902, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87321] Another function of VGAM2583 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026.Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM2583 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12157, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87322] Another function of VGAM2583 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter),

Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.BICD2 (Accession XM_046863) is another VGAM2583 host target gene. BICD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BICD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BICD2 BINDING SITE, designated SEQ ID:34853, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87323] Another function of VGAM2583 is therefore inhibition of BICD2 (Accession XM_046863). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BICD2. FLJ11117 (Accession NM_018329) is another VGAM2583 host target gene. FLJ11117 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ11117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11117 BINDING SITE, designated SEQ ID:20328, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87324] Another function of VGAM2583 is therefore inhibition of FLJ11117 (Accession NM_018329). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11117. FLJ20209 (Accession XM_098142) is another VGAM2583 host target gene. FLJ20209 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE, designated SEQ ID:41406, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87325] Another function of VGAM2583 is therefore inhibition of

FLJ20209 (Accession XM_098142). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20209. KIAA0172 (Accession XM_036295) is another VGAM2583 host target gene. KIAA0172 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0172 BINDING SITE, designated SEQ ID:32413, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87326] Another function of VGAM2583 is therefore inhibition of KIAA0172 (Accession XM_036295). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0172. KIAA0564 (Accession XM_038664) is another VGAM2583 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:32901, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87327] Another function of VGAM2583 is therefore inhibition of KIAA0564 (Accession XM_038664). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM2583 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17435, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87328] Another function of VGAM2583 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PEG10. XPO5 (Accession XM_166042) is another VGAM2583 host target gene. XPO5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPO5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPO5 BINDING SITE, designated SEQ ID:43842, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87329] Another function of VGAM2583 is therefore inhibition of XPO5 (Accession XM_166042). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO5. LOC144558 (Accession XM_096629) is another VGAM2583 host target gene. LOC144558 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144558 BINDING SITE, designated SEQ ID:40439, to the nucleotide sequence of VGAM2583 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5294.

[87330] Another function of VGAM2583 is therefore inhibition of LOC144558 (Accession XM_096629). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144558. LOC151623 (Accession XM_098096) is another VGAM2583 host target gene. LOC151623 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151623 BINDING SITE, designated SEQ ID:41379, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87331] Another function of VGAM2583 is therefore inhibition of LOC151623 (Accession XM_098096). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151623. LOC221962 (Accession XM_166554) is another VGAM2583 host target gene. LOC221962 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221962, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221962 BINDING SITE, designated SEQ ID:44529, to the nucleotide sequence of VGAM2583 RNA, herein designated VGAM RNA, also designated SEQ ID:5294.

[87332] Another function of VGAM2583 is therefore inhibition of LOC221962 (Accession XM_166554). Accordingly, utilities of VGAM2583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2584 (VGAM2584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87333] VGAM2584 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2584 was detected is described hereinabove with reference to Figs. 1-8.

[87334] VGAM2584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satsuma Dwarf Virus.

VGAM2584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87335] VGAM2584 gene encodes a VGAM2584 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2584 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2584 precursor RNA is designated SEQ ID:2570, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2570 is located at position 2340 relative to the genome of Satsuma Dwarf Virus.

[87336] VGAM2584 precursor RNA folds onto itself, forming VGAM2584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87337] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2584 folded precursor RNA into VGAM2584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2584 RNA is designated SEQ ID:5295, and is provided hereinbelow with reference to the sequence listing part.

[87338] VGAM2584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2584 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87339] VGAM2584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2584 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87340] The complementary binding of VGAM2584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2584 host target RNA into VGAM2584 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87341] It is appreciated that VGAM2584 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2584 host target genes. The mRNA of each one of this plurality of VGAM2584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2584 RNA, herein designated VGAM RNA, and which when bound by VGAM2584 RNA causes inhibition of translation of respective one or more VGAM2584 host target proteins.

[87342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2584 gene, herein designated VGAM GENE, on one or more VGAM2584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87343] It is yet further appreciated that a function of VGAM2584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2584 include diagnosis, prevention and treatment of viral infection by Satsuma Dwarf Virus. Specific functions, and accordingly utilities, of VGAM2584 correlate with, and may be deduced from, the identity of the host target genes which VGAM2584 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87344] Nucleotide sequences of the VGAM2584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2584 are further described hereinbelow with reference to Table 1.

[87345] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2584 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2584 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87346] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2584 gene, herein designated VGAM is inhibition of expression of VGAM2584 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2584 correlate with, and may be deduced from, the identity of the target genes which VGAM2584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87347] KIAA0471 (Accession NM_014857) is a VGAM2584 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16909, to the nucleotide sequence of

VGAM2584 RNA, herein designated VGAM RNA, also designated SEQ ID:5295.

[87348] A function of VGAM2584 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM2584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. Ubiquitin-conjugating Enzyme E2N (UBC13 homolog, yeast) (UBE2N, Accession NM_003348) is another VGAM2584 host target gene. UBE2N BINDING SITE1 and UBE2N BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2N, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2N BINDING SITE1 and UBE2N BINDING SITE2, designated SEQ ID:9363 and SEQ ID:45358 respectively, to the nucleotide sequence of VGAM2584 RNA, herein designated VGAM RNA, also designated SEQ ID:5295.

[87349] Another function of VGAM2584 is therefore inhibition of Ubiquitin-conjugating Enzyme E2N (UBC13 homolog, yeast) (UBE2N, Accession NM_003348). Accordingly, utilities of VGAM2584 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with UBE2N. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678) is another VGAM2585 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:9773, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87350] Another function of VGAM2585 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. KIAA1040 (Accession XM_051091) is another VGAM2585 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35743, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87351] Another function of VGAM2585 is therefore inhibition of KIAA1040 (Accession XM_051091). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1204 (Accession XM_045011) is another VGAM2585 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34312, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87352] Another function of VGAM2585 is therefore inhibition of KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. LOC144871 (Accession XM_096698) is another

VGAM2585 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40472, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87353] Another function of VGAM2585 is therefore inhibition of LOC144871 (Accession XM_096698). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC145921 (Accession XM_071845) is another VGAM2585 host target gene. LOC145921 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145921 BINDING SITE, designated SEQ ID:37426, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87354] Another function of VGAM2585 is therefore inhibition of LOC145921 (Accession XM_071845). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145921. LOC150333 (Accession XM_097874) is another VGAM2585 host target gene. LOC150333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150333 BINDING SITE, designated SEQ ID:41196, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87355] Another function of VGAM2585 is therefore inhibition of LOC150333 (Accession XM_097874). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150333. LOC152190 (Accession XM_045692) is another VGAM2585 host target gene. LOC152190 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152190, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152190 BINDING SITE, designated SEQ ID:34525, to the nucleotide sequence of VGAM2585 RNA, herein designated VGAM RNA, also designated SEQ ID:5296.

[87356] Another function of VGAM2585 is therefore inhibition of LOC152190 (Accession XM_045692). Accordingly, utilities of VGAM2585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2586 (VGAM2586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87357] VGAM2586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2586 was detected is described hereinabove with reference to Figs. 1-8.

[87358] VGAM2586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satsuma Dwarf Virus. VGAM2586 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[87359] VGAM2586 gene encodes a VGAM2586 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2586 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2586 precursor RNA is designated SEQ ID:2572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2572 is located at position 5834 relative to the genome of Satsuma Dwarf Virus.

[87360] VGAM2586 precursor RNA folds onto itself, forming VGAM2586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87361] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2586 folded precursor RNA into VGAM2586

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2586 RNA is designated SEQ ID:5297, and is provided hereinbelow with reference to the sequence listing part.

[87362] VGAM2586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2586 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87363] VGAM2586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2586 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87364] The complementary binding of VGAM2586 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2586 host target RNA into VGAM2586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[87365] It is appreciated that VGAM2586 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2586 host target genes. The mRNA of each one of this plurality of VGAM2586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2586 RNA, herein designated VGAM RNA, and which when bound by VGAM2586 RNA causes inhibition of translation of respective one or more VGAM2586 host target proteins.

[87366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2586 gene, herein designated VGAM GENE, on one or more VGAM2586 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87367] It is yet further appreciated that a function of VGAM2586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of viral infection by Satsuma Dwarf Virus. Specific functions, and accordingly utilities, of VGAM2586 correlate with, and may be deduced from, the identity of the host target genes which VGAM2586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87368] Nucleotide sequences of the VGAM2586 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2586 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2586 are further described hereinbelow with reference to Table 1.

[87369] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2586 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2586 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87370] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2586 gene, herein designated VGAM is inhibition of expression of VGAM2586 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2586 correlate with, and may be deduced from, the identity of the target genes which VGAM2586 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87371] Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_033508) is a VGAM2586 host target gene. GCK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCK BINDING SITE, designated SEQ ID:27286, to the nucleotide sequence of VGAM2586

RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87372] A function of VGAM2586 is therefore inhibition of Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_033508), a gene which catalyzes the initial step in utilization of glucose by the beta-cell and liver at physiological glucose concentration. Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCK. The function of GCK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1781.Interleukin 1 Receptor Accessory Protein-like 2 (IL1RAPL2, Accession NM_017416) is another VGAM2586 host target gene. IL1RAPL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL2 BINDING SITE, designated SEQ ID:18873, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87373] Another function of VGAM2586 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 2 (IL1RAPL2, Accession NM_017416), a gene which may act in the development or function of the central nervous system. Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL2. The function of IL1RAPL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1965.FLJ10751 (Accession NM_018239) is another VGAM2586 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20190 and SEQ ID:20091 respectively, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87374] Another function of VGAM2586 is therefore inhibition of

FLJ10751 (Accession NM_018239). Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. KIAA0062 (Accession XM_046677) is another VGAM2586 host target gene. KIAA0062 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0062 BINDING SITE, designated SEQ ID:34793, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87375] Another function of VGAM2586 is therefore inhibition of KIAA0062 (Accession XM_046677). Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0062. KIAA0237 (Accession NM_014747) is another VGAM2586 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16436, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87376] Another function of VGAM2586 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. Lectin, Galactoside-binding, Soluble, 8 (galectin 8) (LGALS8, Accession NM_006499) is another VGAM2586 host target gene. LGALS8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LGALS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS8 BINDING SITE, designated SEQ ID:13244, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87377] Another function of VGAM2586 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 8 (galectin 8) (LGALS8, Accession NM_006499). Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LGALS8. LOC158156 (Accession XM_088496) is another VGAM2586 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39735, to the nucleotide sequence of VGAM2586 RNA, herein designated VGAM RNA, also designated SEQ ID:5297.

[87378] Another function of VGAM2586 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM2586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2587 (VGAM2587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87379] VGAM2587 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2587 was detected is described hereinabove with reference to Figs. 1-8.

[87380] VGAM2587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satsuma Dwarf Virus. VGAM2587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87381] VGAM2587 gene encodes a VGAM2587 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2587 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2587 precursor RNA is designated SEQ ID:2573, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2573 is located at position 4499 relative to the genome of Satsuma Dwarf Virus.

[87382] VGAM2587 precursor RNA folds onto itself, forming VGAM2587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87383] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2587 folded precursor RNA into VGAM2587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2587 RNA is designated SEQ ID:5298, and is provided hereinbelow with reference to the sequence listing part.

[87384] VGAM2587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2587 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87385] VGAM2587 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2587 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2587 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87386] The complementary binding of VGAM2587 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2587 host target RNA into VGAM2587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87387] It is appreciated that VGAM2587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2587 host target genes. The mRNA of each one of this plurality of VGAM2587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2587 RNA, herein designated VGAM RNA, and which when bound by VGAM2587 RNA causes inhibition of translation of respective one or more VGAM2587 host target proteins.

[87388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2587 gene, herein designated VGAM GENE, on one or more VGAM2587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87389] It is yet further appreciated that a function of VGAM2587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of viral infection by Satsuma Dwarf Virus. Specific functions, and accordingly utilities, of VGAM2587 correlate with, and may be deduced from, the identity of the host target genes which VGAM2587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87390] Nucleotide sequences of the VGAM2587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2587 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2587 are further described hereinbelow with reference to Table 1.

[87391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2587 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87392] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2587 gene, herein designated VGAM is inhibition of expression of VGAM2587 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2587 correlate with, and may be deduced from, the identity of the target genes which VGAM2587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87393] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM2587 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7600, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87394] A function of VGAM2587 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.HTRA3 (Accession XM_114416) is another VGAM2587 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42939, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87395] Another function of VGAM2587 is therefore inhibition of HTRA3 (Accession XM_114416). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM_002225) is another VGAM2587 host target gene. IVD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IVD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IVD BINDING SITE, designated SEQ ID:8003, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87396] Another function of VGAM2587 is therefore inhibition of Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM_002225). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with IVD. Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679) is another VGAM2587 host target gene. KMO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:9781, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87397] Another function of VGAM2587 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679), a gene which may play a role in encephalic photoreception. Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO. The function of KMO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM162.SMURF1 (Accession XM_166483) is another VGAM2587 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44416, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87398] Another function of VGAM2587 is therefore inhibition of SMURF1 (Accession XM_166483). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. SPS2 (Accession NM_012248) is another VGAM2587 host target gene. SPS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPS2 BINDING SITE, designated SEQ ID:14556, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87399] Another function of VGAM2587 is therefore inhibition of

SPS2 (Accession NM_012248), a gene which synthesizes selenophosphate from selenide and ATP. Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPS2. The function of SPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1754.VAMP (vesicle-associated membrane protein)-associated Protein A, 33kDa (VAPA, Accession NM_003574) is another VGAM2587 host target gene. VAPA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAPA BINDING SITE, designated SEQ ID:9626, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87400] Another function of VGAM2587 is therefore inhibition of VAMP (vesicle-associated membrane protein)-associated Protein A, 33kDa (VAPA, Accession NM_003574), a gene which may have a role in vesicle trafficking. Accordingly, utilities of VGAM2587 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with VAPA. The function of VAPA has been established by previous studies. By searching an EST database for human homologs of the Aplysia 33-kD VAMP-associated protein (Vap33), Weir et al. (1998) identified a cDNA encoding VAPA, which they termed VAP33. Sequence analysis predicted that the 242-amino acid protein, which is 50% identical to the molluscan sequence, contains 8 potential phosphorylation sites, an alpha-helical coiled-coil domain, and a C-terminal transmembrane domain. Northern blot analysis of mouse tissues detected a major 1.9-kb transcript and minor 3.9- and 7.1-kb transcripts in all tissues tested, with highest expression in brain, testis, ovary, kidney and skeletal muscle. In contrast, Vap33 expression is neuron specific in Aplysia. Western blot analysis showed that VAPA interacts with VAMP1 (OMIM Ref. No. 185880) and VAMP2 (OMIM Ref. No. 185881) but not with SNAP25 (OMIM Ref. No. 600322). Nishimura et al. (1999) identified cDNAs encoding VAPA and the 60% homologous VAPB (OMIM Ref. No. 605704). Northern blot analysis detected a 1.7-kb VAPA transcript in all human tissues tested. SDS-PAGE analysis demonstrated that the transmembrane domain of recombinant VAPA interacted

with VAPA and VAPB fusion proteins.

[87401] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[87402] Weir, M. L.; Klip, A.; Trimble, W. S. : Identification of a human homologue of the vesicle-associated membrane protein (VAMP)-associated protein of 33 kDa (VAP-33): a broadly expressed protein that binds to VAMP. Biochem. J. 333: 247-251, 1998. ; and

[87403] Nishimura, Y.; Hayashi, M.; Inada, H.; Tanaka, T. : Molecular cloning and characterization of mammalian homologues of vesicle-associated membrane protein-associated (VAMP-associated) prote.

[87404] Further studies establishing the function and utilities of VAPA are found in John Hopkins OMIM database record ID 605703, and in sited publications numbered 6617-6618 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM2587 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:14334, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87405] Another function of VGAM2587 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. DKFZP434F091 (Accession NM_015453) is another VGAM2587 host target gene. DKFZP434F091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F091 BINDING SITE, designated SEQ ID:17737, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87406] Another function of VGAM2587 is therefore inhibition of

DKFZP434F091 (Accession NM_015453). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F091. FLJ11413 (Accession NM_024554) is another VGAM2587 host target gene. FLJ11413 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11413 BINDING SITE, designated SEQ ID:23773, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87407] Another function of VGAM2587 is therefore inhibition of FLJ11413 (Accession NM_024554). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11413. KIAA1271 (Accession XM_045472) is another VGAM2587 host target gene. KIAA1271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1271 BINDING SITE, designated SEQ ID:34468, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87408] Another function of VGAM2587 is therefore inhibition of KIAA1271 (Accession XM_045472). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1271. Ligand of Numb-protein X (LNX, Accession NM_032622) is another VGAM2587 host target gene. LNX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LNX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNX BINDING SITE, designated SEQ ID:26339, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87409] Another function of VGAM2587 is therefore inhibition of Ligand of Numb-protein X (LNX, Accession NM_032622). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNX. PRO0246 (Accession

NM_014123) is another VGAM2587 host target gene. PRO0246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0246 BINDING SITE, designated SEQ ID:15379, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87410] Another function of VGAM2587 is therefore inhibition of PRO0246 (Accession NM_014123). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0246. LOC143154 (Accession XM_084441) is another VGAM2587 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37589, to the nucleotide sequence of VGAM2587 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5298.

[87411] Another function of VGAM2587 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC204970 (Accession XM_114795) is another VGAM2587 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43075, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87412] Another function of VGAM2587 is therefore inhibition of LOC204970 (Accession XM_114795). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC219294 (Accession XM_167566) is another VGAM2587 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219294, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44687, to the nucleotide sequence of VGAM2587 RNA, herein designated VGAM RNA, also designated SEQ ID:5298.

[87413] Another function of VGAM2587 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM2587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2588 (VGAM2588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87414] VGAM2588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2588 was detected is described hereinabove with reference to Figs. 1-8.

[87415] VGAM2588 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satsuma Dwarf Virus.

VGAM2588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87416] VGAM2588 gene encodes a VGAM2588 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2588 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2588 precursor RNA is designated SEQ ID:2574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2574 is located at position 1651 relative to the genome of Satsuma Dwarf Virus.

[87417] VGAM2588 precursor RNA folds onto itself, forming VGAM2588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87418] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2588 folded precursor RNA into VGAM2588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2588 RNA is designated SEQ ID:5299, and is provided hereinbelow with reference to the sequence listing part.

[87419] VGAM2588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2588 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2588 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87420] VGAM2588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2588 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2588 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87421] The complementary binding of VGAM2588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2588 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2588 host target RNA into VGAM2588 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87422] It is appreciated that VGAM2588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2588 host target genes. The mRNA of each one of this plurality of VGAM2588 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2588 RNA, herein designated VGAM RNA, and which when bound by VGAM2588 RNA causes inhibition of translation of respective one or more VGAM2588 host target proteins.

[87423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2588 gene, herein designated VGAM GENE, on one or more VGAM2588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87424] It is yet further appreciated that a function of VGAM2588 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of viral infection by Satsuma Dwarf Virus. Specific functions, and accordingly utilities, of VGAM2588 correlate with, and may be deduced from, the identity of the host target genes which VGAM2588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87425] Nucleotide sequences of the VGAM2588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2588 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2588 are further described hereinbelow with reference to Table 1.

[87426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2588 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2588 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87427] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2588 gene, herein designated VGAM is inhibition of expression of VGAM2588 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2588 correlate with, and may be deduced from, the identity of the target genes which VGAM2588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87428] Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is a VGAM2588 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ

ID:32539, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87429] A function of VGAM2588 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.FLJ21817 (Accession NM_022448) is another VGAM2588 host target gene. FLJ21817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21817 BINDING SITE, designated SEQ ID:22784, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87430] Another function of VGAM2588 is therefore inhibition of

FLJ21817 (Accession NM_022448). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21817. KIAA1069 (Accession XM_042635) is another VGAM2588 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33722, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87431] Another function of VGAM2588 is therefore inhibition of KIAA1069 (Accession XM_042635). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. PHRET1 (Accession NM_021200) is another VGAM2588 host target gene. PHRET1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHRET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PHRET1 BINDING SITE, designated SEQ ID:22176, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87432] Another function of VGAM2588 is therefore inhibition of PHRET1 (Accession NM_021200). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHRET1. PRO1600 (Accession NM_014095) is another VGAM2588 host target gene. PRO1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1600 BINDING SITE, designated SEQ ID:15313, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87433] Another function of VGAM2588 is therefore inhibition of PRO1600 (Accession NM_014095). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1600. SMT3 Suppressor of Mif Two 3 Homolog 2

(yeast) (SMT3H2, Accession NM_006937) is another VGAM2588 host target gene. SMT3H2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMT3H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H2 BINDING SITE, designated SEQ ID:13819, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87434] Another function of VGAM2588 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM_006937). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H2. LOC143888 (Accession XM_084669) is another VGAM2588 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37672, to

the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87435] Another function of VGAM2588 is therefore inhibition of LOC143888 (Accession XM_084669). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC157695 (Accession XM_098811) is another VGAM2588 host target gene. LOC157695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157695 BINDING SITE, designated SEQ ID:41832, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87436] Another function of VGAM2588 is therefore inhibition of LOC157695 (Accession XM_098811). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157695. LOC158997 (Accession XM_088736) is another VGAM2588 host target gene. LOC158997 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC158997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158997 BINDING SITE, designated SEQ ID:39933, to the nucleotide sequence of VGAM2588 RNA, herein designated VGAM RNA, also designated SEQ ID:5299.

[87437] Another function of VGAM2588 is therefore inhibition of LOC158997 (Accession XM_088736). Accordingly, utilities of VGAM2588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2589 (VGAM2589) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87438] VGAM2589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2589 was detected is described hereinabove with reference to Figs. 1-8.

[87439] VGAM2589 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Apple Latent Spherical Virus. VGAM2589 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87440] VGAM2589 gene encodes a VGAM2589 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2589 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2589 precursor RNA is designated SEQ ID:2575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2575 is located at position 1180 relative to the genome of Apple Latent Spherical Virus.

[87441] VGAM2589 precursor RNA folds onto itself, forming VGAM2589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87442] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2589 folded precursor RNA into VGAM2589 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2589 RNA is designated SEQ ID:5300, and is provided hereinbelow with reference to the sequence listing part.

[87443] VGAM2589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2589 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87444] VGAM2589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2589 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2589 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2589 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87445] The complementary binding of VGAM2589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2589

host target RNA into VGAM2589 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87446] It is appreciated that VGAM2589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2589 host target genes. The mRNA of each one of this plurality of VGAM2589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2589 RNA, herein designated VGAM RNA, and which when bound by VGAM2589 RNA causes inhibition of translation of respective one or more VGAM2589 host target proteins.

[87447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2589 gene, herein designated VGAM GENE, on one or more VGAM2589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87448] It is yet further appreciated that a function of VGAM2589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2589 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2589 correlate with, and may be deduced from, the identity of the host target genes which VGAM2589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87449] Nucleotide sequences of the VGAM2589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2589 are further

described hereinbelow with reference to Table 1.

[87450] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2589 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87451] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2589 gene, herein designated VGAM is inhibition of expression of VGAM2589 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2589 correlate with, and may be deduced from, the identity of the target genes which VGAM2589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87452] ATP-binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM_002858) is a VGAM2589 host target gene. ABCD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ABCD3 BINDING SITE, designated SEQ ID:8752, to the nucleotide sequence of VGAM2589 RNA, herein designated VGAM RNA, also designated SEQ ID:5300.

[87453] A function of VGAM2589 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM_002858), a gene which a probable transporter. Accordingly, utilities of VGAM2589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD3. The function of ABCD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1775.Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036) is another VGAM2589 host target gene. ESM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESM1 BINDING SITE, designated SEQ ID:13912, to the nucleotide sequence of VGAM2589 RNA, herein designated VGAM RNA, also designated SEQ ID:5300.

[87454] Another function of VGAM2589 is therefore inhibition of Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036). Accordingly, utilities of VGAM2589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESM1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2590 (VGAM2590) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87455] VGAM2590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2590 was detected is described hereinabove with reference to Figs. 1-8.

[87456] VGAM2590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2590 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87457] VGAM2590 gene encodes a VGAM2590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2590 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2590 precursor RNA is designated SEQ ID:2576, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2576 is located at position 2408 relative to the genome of Apple Latent Spherical Virus.

[87458] VGAM2590 precursor RNA folds onto itself, forming VGAM2590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87459] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2590 folded precursor RNA into VGAM2590 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2590 RNA is designated SEQ ID:5301, and is provided hereinbelow with reference to the sequence listing part.

[87460] VGAM2590 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2590 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87461] VGAM2590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2590 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2590 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2590 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87462] The complementary binding of VGAM2590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2590 host target RNA into VGAM2590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87463] It is appreciated that VGAM2590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2590 host target genes. The mRNA of each one of this plurality of VGAM2590 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2590 RNA, herein designated VGAM RNA, and which when bound by VGAM2590 RNA causes inhibition of translation of respective one or more VGAM2590 host target proteins.

[87464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2590 gene, herein designated VGAM GENE, on one or more VGAM2590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87465] It is yet further appreciated that a function of VGAM2590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2590 correlate with, and may be deduced from, the identity of the host target genes which VGAM2590 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87466] Nucleotide sequences of the VGAM2590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2590 are further described hereinbelow with reference to Table 1.

[87467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2590 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2590 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[87468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2590 gene, herein designated VGAM is inhibition of expression of VGAM2590 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2590 correlate with, and may be deduced from, the identity of the target genes which VGAM2590 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87469] Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332) is a VGAM2590 host target gene. ANKTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ ID:14260, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87470] A function of VGAM2590 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332), a gene which attaches integral

membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644.Calcium Channel, Voltage-dependent, Alpha 2/delta 3 Subunit (CACNA2D3, Accession NM_018398) is another VGAM2590 host target gene. CACNA2D3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CACNA2D3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D3 BINDING SITE, designated SEQ ID:20435, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87471] Another function of VGAM2590 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta 3 Subunit (CACNA2D3, Accession NM_018398). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CACNA2D3. Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246) is another VGAM2590 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15513, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87472] Another function of VGAM2590 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.7-dehydrocholesterol Reductase (DHCR7, Ac-

cession NM_001360) is another VGAM2590 host target gene. DHCR7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DHCR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR7 BINDING SITE, designated SEQ ID:7039, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87473] Another function of VGAM2590 is therefore inhibition of 7-dehydrocholesterol Reductase (DHCR7, Accession NM_001360). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR7. V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274) is another VGAM2590 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ

ID:32045, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87474] Another function of VGAM2590 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1. The function of MYBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM184.Phosphodiesterase 4C, CAMP-specific (phosphodiesterase E1 dunce homolog, Drosophila) (PDE4C, Accession NM_000923) is another VGAM2590 host target gene. PDE4C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4C BINDING SITE, des-

ignated SEQ ID:6634, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87475] Another function of VGAM2590 is therefore inhibition of Phosphodiesterase 4C, CAMP-specific (phosphodiesterase E1 dunce homolog, Drosophila) (PDE4C, Accession NM_000923), a gene which is a cAMP-specific phosphodiesterase and may be a protein involved in learning and memory. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4C. The function of PDE4C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1965.Polymyositis/scleroderma Autoantigen 1, 75kDa (PMSCL1, Accession NM_005033) is another VGAM2590 host target gene. PMSCL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PMSCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMSCL1 BINDING SITE, designated SEQ ID:11474, to the nucleotide

sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87476] Another function of VGAM2590 is therefore inhibition of Polymyositis/scleroderma Autoantigen 1, 75kDa (PMSCL1, Accession NM_005033). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMSCL1. POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is another VGAM2590 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12903, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87477] Another function of VGAM2590 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM2590 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026.Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187) is another VGAM2590 host target gene. PRKCB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCB1 BINDING SITE, designated SEQ ID:34904, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87478] Another function of VGAM2590 is therefore inhibition of Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187), a gene which is a calcium-activated, phospholipid-dependent, serine- and threonine-specific enzyme. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCB1. The function of PRKCB1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2065.SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023) is another VGAM2590 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8953, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87479] Another function of VGAM2590 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686) is another VGAM2590 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12243, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87480] Another function of VGAM2590 is therefore inhibition of SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13. Sp3 Transcription Factor (SP3, Accession XM_092672) is another VGAM2590 host target gene. SP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP3 BINDING SITE, designated SEQ ID:40134, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87481] Another function of VGAM2590 is therefore inhibition of Sp3 Transcription Factor (SP3, Accession XM_092672), a gene which binds to gt and gc boxes promoters elements.

Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP3. The function of SP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM861.TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333) is another VGAM2590 host target gene. TIAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAL1 BINDING SITE, designated SEQ ID:22743, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87482] Another function of VGAM2590 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAL1. The function of

TIAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350.Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM_138691) is another VGAM2590 host target gene. TMC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMC1 BINDING SITE, designated SEQ ID:28932, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87483] Another function of VGAM2590 is therefore inhibition of Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM_138691), a gene which is required for normal function of cochlear hair cells. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMC1. The function of TMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM554.Thioredoxin Reductase 1 (TXNRD1, Accession

NM_003330) is another VGAM2590 host target gene. TXNRD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TXNRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXNRD1 BINDING SITE, designated SEQ ID:9337, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87484] Another function of VGAM2590 is therefore inhibition of Thioredoxin Reductase 1 (TXNRD1, Accession NM_003330), a gene which acts as an antioxidant enzyme and is involved in maintaining redox balance. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNRD1. The function of TXNRD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695) is another VGAM2590 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35486, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87485] Another function of VGAM2590 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.ABLIM (Accession NM_002313) is another VGAM2590 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8121 and SEQ ID:13554 respectively, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87486] Another function of VGAM2590 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. BPES (Accession NM_023067) is another VGAM2590 host target gene. BPES BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BPES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPES BINDING SITE, designated SEQ ID:23326, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87487] Another function of VGAM2590 is therefore inhibition of BPES (Accession NM_023067). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPES.

Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312) is another VGAM2590 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20305, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87488] Another function of VGAM2590 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821) is another VGAM2590 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C20orf108 BINDING SITE, designated SEQ ID:28083, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87489] Another function of VGAM2590 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2590 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33041, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87490] Another function of VGAM2590 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM2590 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ10702 (Accession NM_018184) is another VGAM2590 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10702 BINDING SITE, designated SEQ ID:20029, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87491] Another function of VGAM2590 is therefore inhibition of FLJ10702 (Accession NM_018184). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. FLJ21438 (Accession XM_029084) is another VGAM2590 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438

BINDING SITE, designated SEQ ID:30846, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87492] Another function of VGAM2590 is therefore inhibition of FLJ21438 (Accession XM_029084). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21438. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758) is another VGAM2590 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:12325, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87493] Another function of VGAM2590 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HN-

RPA3. KIAA0133 (Accession NM_014777) is another VGAM2590 host target gene. KIAA0133 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0133 BINDING SITE, designated SEQ ID:16610, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87494] Another function of VGAM2590 is therefore inhibition of KIAA0133 (Accession NM_014777). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0133. KIAA0469 (Accession NM_014851) is another VGAM2590 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16897, to the nucleotide sequence of VGAM2590 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5301.

[87495] Another function of VGAM2590 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA1023 (Accession NM_017604) is another VGAM2590 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19094, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87496] Another function of VGAM2590 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1069 (Accession XM_042635) is another VGAM2590 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1069, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33726, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87497] Another function of VGAM2590 is therefore inhibition of KIAA1069 (Accession XM_042635). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. KIAA1203 (Accession XM_049683) is another VGAM2590 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35472, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87498] Another function of VGAM2590 is therefore inhibition of KIAA1203 (Accession XM_049683). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1203. KIAA1872 (Accession XM_031917) is another VGAM2590 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31525, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87499] Another function of VGAM2590 is therefore inhibition of KIAA1872 (Accession XM_031917). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. LHX6 (Accession NM_014368) is another VGAM2590 host target gene. LHX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:15701, to the nucleotide sequence of

VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87500] Another function of VGAM2590 is therefore inhibition of LHX6 (Accession NM_014368). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX6. Lipase, Endothelial (LIPG, Accession NM_006033) is another VGAM2590 host target gene. LIPG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:12656, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87501] Another function of VGAM2590 is therefore inhibition of Lipase, Endothelial (LIPG, Accession NM_006033). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG. MGC15634 (Accession NM_032755) is another VGAM2590 host target gene. MGC15634 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by MGC15634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15634 BINDING SITE, designated SEQ ID:26497, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87502] Another function of VGAM2590 is therefore inhibition of MGC15634 (Accession NM_032755). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15634. MGC26684 (Accession NM_144568) is another VGAM2590 host target gene. MGC26684 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC26684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26684 BINDING SITE, designated SEQ ID:29374, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87503] Another function of VGAM2590 is therefore inhibition of MGC26684 (Accession NM_144568). Accordingly, utilities

of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26684. NCUBE1 (Accession NM_016021) is another VGAM2590 host target gene. NCUBE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCUBE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCUBE1 BINDING SITE, designated SEQ ID:18095, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87504] Another function of VGAM2590 is therefore inhibition of NCUBE1 (Accession NM_016021). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCUBE1. N-myristoyltransferase 1 (NMT1, Accession NM_021079) is another VGAM2590 host target gene. NMT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of NMT1 BINDING SITE, designated SEQ ID:22052, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87505] Another function of VGAM2590 is therefore inhibition of N-myristoyltransferase 1 (NMT1, Accession NM_021079). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMT1. NYD-SP11 (Accession NM_031951) is another VGAM2590 host target gene. NYD-SP11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NYD-SP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP11 BINDING SITE, designated SEQ ID:25689, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87506] Another function of VGAM2590 is therefore inhibition of NYD-SP11 (Accession NM_031951). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP11. Oxysterol Binding Protein-like 3 (OSBPL3, Ac-

cession NM_015550) is another VGAM2590 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17817, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87507] Another function of VGAM2590 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. POU Domain, Class 4, Transcription Factor 2 (POU4F2, Accession NM_004575) is another VGAM2590 host target gene. POU4F2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F2 BINDING SITE, designated SEQ ID:10920, to the

nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87508] Another function of VGAM2590 is therefore inhibition of POU Domain, Class 4, Transcription Factor 2 (POU4F2, Accession NM_004575). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F2. PP1665 (Accession NM_030792) is another VGAM2590 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:25093, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87509] Another function of VGAM2590 is therefore inhibition of PP1665 (Accession NM_030792). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. Syntaphilin (SNPH, Accession NM_014723) is another VGAM2590 host target gene. SNPH BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16301, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87510] Another function of VGAM2590 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. Stomatin (EPB72)-like 1 (STOML1, Accession NM_004809) is another VGAM2590 host target gene. STOML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STOML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STOML1 BINDING SITE, designated SEQ ID:11233, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87511] Another function of VGAM2590 is therefore inhibition of Stomatin (EPB72)-like 1 (STOML1, Accession NM_004809). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STOML1. LOC124216 (Accession XM_058783) is another VGAM2590 host target gene. LOC124216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124216 BINDING SITE, designated SEQ ID:36738, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87512] Another function of VGAM2590 is therefore inhibition of LOC124216 (Accession XM_058783). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124216. LOC126302 (Accession XM_059020) is another VGAM2590 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126302, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36826, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87513] Another function of VGAM2590 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC131870 (Accession XM_059544) is another VGAM2590 host target gene. LOC131870 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC131870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131870 BINDING SITE, designated SEQ ID:37015, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87514] Another function of VGAM2590 is therefore inhibition of LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC131870. LOC138399 (Accession XM_059971) is another VGAM2590 host target gene. LOC138399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138399 BINDING SITE, designated SEQ ID:37130, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87515] Another function of VGAM2590 is therefore inhibition of LOC138399 (Accession XM_059971). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138399. LOC145955 (Accession XM_096912) is another VGAM2590 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40647, to

the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87516] Another function of VGAM2590 is therefore inhibition of LOC145955 (Accession XM_096912). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC149464 (Accession XM_097645) is another VGAM2590 host target gene. LOC149464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149464 BINDING SITE, designated SEQ ID:40997, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87517] Another function of VGAM2590 is therefore inhibition of LOC149464 (Accession XM_097645). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149464. LOC150468 (Accession XM_086926) is another VGAM2590 host target gene. LOC150468 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC150468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150468 BINDING SITE, designated SEQ ID:38977, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87518] Another function of VGAM2590 is therefore inhibition of LOC150468 (Accession XM_086926). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150468. LOC155066 (Accession XM_088142) is another VGAM2590 host target gene. LOC155066 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155066 BINDING SITE, designated SEQ ID:39541, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87519] Another function of VGAM2590 is therefore inhibition of LOC155066 (Accession XM_088142). Accordingly, utilities

of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155066. LOC155179 (Accession XM_088169) is another VGAM2590 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39560, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87520] Another function of VGAM2590 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC159053 (Accession XM_099021) is another VGAM2590 host target gene. LOC159053 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC159053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC159053 BINDING SITE, designated SEQ ID:42061, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87521] Another function of VGAM2590 is therefore inhibition of LOC159053 (Accession XM_099021). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159053. LOC201562 (Accession XM_114343) is another VGAM2590 host target gene. LOC201562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201562 BINDING SITE, designated SEQ ID:42885, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87522] Another function of VGAM2590 is therefore inhibition of LOC201562 (Accession XM_114343). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201562. LOC201771 (Accession XM_046083) is another VGAM2590 host target gene. LOC201771 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201771 BINDING SITE, designated SEQ ID:34678, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87523] Another function of VGAM2590 is therefore inhibition of LOC201771 (Accession XM_046083). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201771. LOC203378 (Accession XM_117541) is another VGAM2590 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43562, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87524] Another function of VGAM2590 is therefore inhibition of

LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC219918 (Accession XM_166197) is another VGAM2590 host target gene. LOC219918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:44003, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87525] Another function of VGAM2590 is therefore inhibition of LOC219918 (Accession XM_166197). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918. LOC220071 (Accession XM_167848) is another VGAM2590 host target gene. LOC220071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:44878, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87526] Another function of VGAM2590 is therefore inhibition of LOC220071 (Accession XM_167848). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071. LOC220988 (Accession XM_165561) is another VGAM2590 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43685, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87527] Another function of VGAM2590 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. LOC221747 (Accession XM_166460) is an-

other VGAM2590 host target gene. LOC221747 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221747 BINDING SITE, designated SEQ ID:44366, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87528] Another function of VGAM2590 is therefore inhibition of LOC221747 (Accession XM_166460). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221747. LOC254085 (Accession XM_171189) is another VGAM2590 host target gene. LOC254085 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254085 BINDING SITE, designated SEQ ID:45974, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87529] Another function of VGAM2590 is therefore inhibition of LOC254085 (Accession XM_171189). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254085. LOC256940 (Accession XM_172879) is another VGAM2590 host target gene. LOC256940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256940 BINDING SITE, designated SEQ ID:46157, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87530] Another function of VGAM2590 is therefore inhibition of LOC256940 (Accession XM_172879). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256940. LOC257471 (Accession XM_171020) is another VGAM2590 host target gene. LOC257471 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257471, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257471 BINDING SITE, designated SEQ ID:45786, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87531] Another function of VGAM2590 is therefore inhibition of LOC257471 (Accession XM_171020). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257471. LOC92228 (Accession XM_043731) is another VGAM2590 host target gene. LOC92228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92228 BINDING SITE, designated SEQ ID:34004, to the nucleotide sequence of VGAM2590 RNA, herein designated VGAM RNA, also designated SEQ ID:5301.

[87532] Another function of VGAM2590 is therefore inhibition of LOC92228 (Accession XM_043731). Accordingly, utilities of VGAM2590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2591 (VGAM2591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87533] VGAM2591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2591 was detected is described hereinabove with reference to Figs. 1-8.

[87534] VGAM2591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2591 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87535] VGAM2591 gene encodes a VGAM2591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2591 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2591 precursor RNA is designated SEQ ID:2577, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2577 is located at position 6309 relative to the genome of Apple Latent Spherical Virus.

[87536] VGAM2591 precursor RNA folds onto itself, forming VGAM2591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87537] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2591 folded precursor RNA into VGAM2591 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM2591 RNA is designated SEQ ID:5302, and is provided hereinbelow with reference to the sequence listing part.

[87538] VGAM2591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2591 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87539] VGAM2591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2591 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2591 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2591 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87540] The complementary binding of VGAM2591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2591 host target RNA into VGAM2591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87541] It is appreciated that VGAM2591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2591 host target genes. The mRNA of each one of this plurality of VGAM2591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2591 RNA, herein designated VGAM RNA, and which when bound by VGAM2591 RNA causes

inhibition of translation of respective one or more VGAM2591 host target proteins.

[87542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2591 gene, herein designated VGAM GENE, on one or more VGAM2591 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87543] It is yet further appreciated that a function of VGAM2591 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2591 include diagnosis, prevention and

treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2591 correlate with, and may be deduced from, the identity of the host target genes which VGAM2591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87544] Nucleotide sequences of the VGAM2591 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2591 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2591 are further described hereinbelow with reference to Table 1.

[87545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2591 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2591 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87546] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2591 gene, herein designated VGAM is inhibition of expression of VGAM2591 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2591 correlate with, and may be deduced from, the identity of the target genes which VGAM2591 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87547] Sorting Nexin 6 (SNX6, Accession NM_021249) is a VGAM2591 host target gene. SNX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX6 BINDING SITE, designated SEQ ID:22217, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87548] A function of VGAM2591 is therefore inhibition of Sorting Nexin 6 (SNX6, Accession NM_021249). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX6. FLJ12287 (Accession NM_022367) is another VGAM2591 host target gene. FLJ12287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12287, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12287 BINDING SITE, designated SEQ ID:22752, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87549] Another function of VGAM2591 is therefore inhibition of FLJ12287 (Accession NM_022367). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12287. Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185) is another VGAM2591 host target gene. WNT2B BINDING SITE1 and WNT2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2B BINDING SITE1 and WNT2B BINDING SITE2, designated SEQ ID:10391 and SEQ ID:23692 respectively, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87550] Another function of VGAM2591 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT2B. LOC220776 (Accession XM_043388) is another VGAM2591 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33927, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87551] Another function of VGAM2591 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC253936 (Accession XM_170637) is another VGAM2591 host target gene. LOC253936 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253936, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253936 BINDING SITE, designated SEQ ID:45407, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87552] Another function of VGAM2591 is therefore inhibition of LOC253936 (Accession XM_170637). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253936. LOC91138 (Accession XM_036406) is another VGAM2591 host target gene. LOC91138 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91138 BINDING SITE, designated SEQ ID:32438, to the nucleotide sequence of VGAM2591 RNA, herein designated VGAM RNA, also designated SEQ ID:5302.

[87553] Another function of VGAM2591 is therefore inhibition of LOC91138 (Accession XM_036406). Accordingly, utilities of VGAM2591 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91138. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2592 (VGAM2592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87554] VGAM2592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2592 was detected is described hereinabove with reference to Figs. 1-8.

[87555] VGAM2592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87556] VGAM2592 gene encodes a VGAM2592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2592 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2592 precursor RNA is desig-

nated SEQ ID:2578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2578 is located at position 1588 relative to the genome of Apple Latent Spherical Virus.

[87557] VGAM2592 precursor RNA folds onto itself, forming VGAM2592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87558] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2592 folded precursor RNA into VGAM2592 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2592 RNA is designated SEQ ID:5303, and is provided hereinbelow with reference to the sequence

listing part.

[87559] VGAM2592 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2592 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2592 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87560] VGAM2592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2592 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2592 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2592 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87561] The complementary binding of VGAM2592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2592 host target RNA into VGAM2592 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87562] It is appreciated that VGAM2592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2592 host target genes. The mRNA of each one of this plurality of VGAM2592 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2592 RNA, herein designated VGAM

RNA, and which when bound by VGAM2592 RNA causes inhibition of translation of respective one or more VGAM2592 host target proteins.

[87563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2592 gene, herein designated VGAM GENE, on one or more VGAM2592 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87564] It is yet further appreciated that a function of VGAM2592 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2592 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2592 correlate with, and may be deduced from, the identity of the host target genes which VGAM2592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87565] Nucleotide sequences of the VGAM2592 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2592 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2592 are further described hereinbelow with reference to Table 1.

[87566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2592 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2592 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87567] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2592 gene, herein designated VGAM is

inhibition of expression of VGAM2592 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2592 correlate with, and may be deduced from, the identity of the target genes which VGAM2592 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87568] MIG (Accession NM_002416) is a VGAM2592 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8243, to the nucleotide sequence of VGAM2592 RNA, herein designated VGAM RNA, also designated SEQ ID:5303.

[87569] A function of VGAM2592 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM2592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. PRO1596 (Accession NM_031270) is another VGAM2592 host target gene. PRO1596 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1596, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1596 BINDING SITE, designated SEQ ID:25294, to the nucleotide sequence of VGAM2592 RNA, herein designated VGAM RNA, also designated SEQ ID:5303.

[87570] Another function of VGAM2592 is therefore inhibition of PRO1596 (Accession NM_031270). Accordingly, utilities of VGAM2592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1596. LOC256073 (Accession XM_172972) is another VGAM2592 host target gene. LOC256073 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256073 BINDING SITE, designated SEQ ID:46229, to the nucleotide sequence of VGAM2592 RNA, herein designated VGAM RNA, also designated SEQ ID:5303.

[87571] Another function of VGAM2592 is therefore inhibition of LOC256073 (Accession XM_172972). Accordingly, utilities of VGAM2592 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2593 (VGAM2593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87572] VGAM2593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2593 was detected is described hereinabove with reference to Figs. 1-8.

[87573] VGAM2593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2593 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87574] VGAM2593 gene encodes a VGAM2593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2593 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2593 precursor RNA is desig-

nated SEQ ID:2579, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2579 is located at position 5091 relative to the genome of Apple Latent Spherical Virus.

[87575] VGAM2593 precursor RNA folds onto itself, forming VGAM2593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87576] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2593 folded precursor RNA into VGAM2593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2593 RNA is designated SEQ ID:5304, and is provided hereinbelow with reference to the sequence

listing part.

[87577] VGAM2593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2593 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87578] VGAM2593 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2593 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2593 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87579] The complementary binding of VGAM2593 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2593 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2593 host target RNA into VGAM2593 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87580] It is appreciated that VGAM2593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2593 host target genes. The mRNA of each one of this plurality of VGAM2593 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2593 RNA, herein designated VGAM

RNA, and which when bound by VGAM2593 RNA causes inhibition of translation of respective one or more VGAM2593 host target proteins.

[87581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2593 gene, herein designated VGAM GENE, on one or more VGAM2593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87582] It is yet further appreciated that a function of VGAM2593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2593 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2593 correlate with, and may be deduced from, the identity of the host target genes which VGAM2593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87583] Nucleotide sequences of the VGAM2593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2593 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2593 are further described hereinbelow with reference to Table 1.

[87584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2593 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87585] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2593 gene, herein designated VGAM is

inhibition of expression of VGAM2593 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2593 correlate with, and may be deduced from, the identity of the target genes which VGAM2593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87586] Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (S. cerevisiae) (SIRT1, Accession NM_012238) is a VGAM2593 host target gene. SIRT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT1 BINDING SITE, designated SEQ ID:14542, to the nucleotide sequence of VGAM2593 RNA, herein designated VGAM RNA, also designated SEQ ID:5304.

[87587] A function of VGAM2593 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (S. cerevisiae) (SIRT1, Accession NM_012238), a gene which may function as intracellular regulatory protein with mono-ADP-ribosyltransferase activity. Accordingly, utilities of VGAM2593 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SIRT1. The function of SIRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM244.FLJ20725 (Accession NM_017943) is another VGAM2593 host target gene. FLJ20725 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20725 BINDING SITE, designated SEQ ID:19636, to the nucleotide sequence of VGAM2593 RNA, herein designated VGAM RNA, also designated SEQ ID:5304.

[87588] Another function of VGAM2593 is therefore inhibition of FLJ20725 (Accession NM_017943). Accordingly, utilities of VGAM2593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20725. LOC122773 (Accession XM_058665) is another VGAM2593 host target gene. LOC122773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122773, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122773 BINDING SITE, designated SEQ ID:36710, to the nucleotide sequence of VGAM2593 RNA, herein designated VGAM RNA, also designated SEQ ID:5304.

[87589] Another function of VGAM2593 is therefore inhibition of LOC122773 (Accession XM_058665). Accordingly, utilities of VGAM2593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122773. LOC152200 (Accession XM_098174) is another VGAM2593 host target gene. LOC152200 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152200 BINDING SITE, designated SEQ ID:41437, to the nucleotide sequence of VGAM2593 RNA, herein designated VGAM RNA, also designated SEQ ID:5304.

[87590] Another function of VGAM2593 is therefore inhibition of LOC152200 (Accession XM_098174). Accordingly, utilities of VGAM2593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152200. LOC221931 (Accession XM_168348) is another VGAM2593 host target gene. LOC221931 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221931 BINDING SITE, designated SEQ ID:45118, to the nucleotide sequence of VGAM2593 RNA, herein designated VGAM RNA, also designated SEQ ID:5304.

[87591] Another function of VGAM2593 is therefore inhibition of LOC221931 (Accession XM_168348). Accordingly, utilities of VGAM2593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221931. LOC91947 (Accession XM_041721) is another VGAM2593 host target gene. LOC91947 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91947, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91947 BINDING SITE, designated SEQ ID:33568, to the nucleotide sequence of VGAM2593 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5304.

[87592] Another function of VGAM2593 is therefore inhibition of LOC91947 (Accession XM_041721). Accordingly, utilities of VGAM2593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2594 (VGAM2594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87593] VGAM2594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2594 was detected is described hereinabove with reference to Figs. 1-8.

[87594] VGAM2594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87595] VGAM2594 gene encodes a VGAM2594 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2594 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2594 precursor RNA is designated SEQ ID:2580, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2580 is located at position 1452 relative to the genome of Apple Latent Spherical Virus.

[87596] VGAM2594 precursor RNA folds onto itself, forming VGAM2594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2594 folded precursor RNA into VGAM2594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2594 RNA is designated SEQ ID:5305, and is provided hereinbelow with reference to the sequence listing part.

[87598] VGAM2594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2594 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2594 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87599] VGAM2594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2594 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87600] The complementary binding of VGAM2594 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2594 host target RNA into VGAM2594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87601] It is appreciated that VGAM2594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2594 host target genes. The mRNA of

each one of this plurality of VGAM2594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2594 RNA, herein designated VGAM RNA, and which when bound by VGAM2594 RNA causes inhibition of translation of respective one or more VGAM2594 host target proteins.

[87602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2594 gene, herein designated VGAM GENE, on one or more VGAM2594 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[87603] It is yet further appreciated that a function of VGAM2594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2594 correlate with, and may be deduced from, the identity of the host target genes which VGAM2594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87604] Nucleotide sequences of the VGAM2594 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2594 are further described hereinbelow with reference to Table 1.

[87605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2594 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2594 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2594 gene, herein designated VGAM is inhibition of expression of VGAM2594 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2594 correlate with, and may be deduced from, the identity of the target genes which VGAM2594 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87607] Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM_001945) is a VGAM2594 host target gene. DTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTR BINDING SITE, designated SEQ ID:7658, to the nucleotide sequence of VGAM2594 RNA, herein designated VGAM RNA, also designated SEQ ID:5305.

[87608] A function of VGAM2594 is therefore inhibition of Diphtheria Toxin Receptor (heparin-binding epidermal growth

factor-like growth factor) (DTR, Accession NM_001945), a gene which may be involved in macrophage-mediated cellular proliferation. Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTR. The function of DTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM242.Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411) is another VGAM2594 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5994, to the nucleotide sequence of VGAM2594 RNA, herein designated VGAM RNA, also designated SEQ ID:5305.

[87609] Another function of VGAM2594 is therefore inhibition of Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase

(ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. NORE1 (Accession NM_031437) is another VGAM2594 host target gene. NORE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NORE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NORE1 BINDING SITE, designated SEQ ID:25440, to the nucleotide sequence of VGAM2594 RNA, herein designated VGAM RNA, also designated SEQ ID:5305.

[87610] Another function of VGAM2594 is therefore inhibition of NORE1 (Accession NM_031437), a gene which may modulate intracellular signal transduction pathways. Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NORE1. The function of NORE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.AUT-like 1, Cysteine

Endopeptidase (S. cerevisiae) (AUTL1, Accession NM_032852) is another VGAM2594 host target gene. AUTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ ID:26646, to the nucleotide sequence of VGAM2594 RNA, herein designated VGAM RNA, also designated SEQ ID:5305.

[87611] Another function of VGAM2594 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (S. cerevisiae) (AUTL1, Accession NM_032852). Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. KIAA1143 (Accession XM_044014) is another VGAM2594 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE,

designated SEQ ID:34068, to the nucleotide sequence of VGAM2594 RNA, herein designated VGAM RNA, also designated SEQ ID:5305.

[87612] Another function of VGAM2594 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM2594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2595 (VGAM2595) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87613] VGAM2595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2595 was detected is described hereinabove with reference to Figs. 1-8.

[87614] VGAM2595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple Latent Spherical Virus. VGAM2595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87615] VGAM2595 gene encodes a VGAM2595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2595 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2595 precursor RNA is designated SEQ ID:2581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2581 is located at position 6486 relative to the genome of Apple Latent Spherical Virus.

[87616] VGAM2595 precursor RNA folds onto itself, forming VGAM2595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87617] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2595 folded precursor RNA into VGAM2595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2595 RNA is designated SEQ ID:5306, and is provided hereinbelow with reference to the sequence listing part.

[87618] VGAM2595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2595 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87619] VGAM2595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2595 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87620] The complementary binding of VGAM2595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2595 host target RNA into VGAM2595 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87621] It is appreciated that VGAM2595 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2595 host target genes. The mRNA of each one of this plurality of VGAM2595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2595 RNA, herein designated VGAM RNA, and which when bound by VGAM2595 RNA causes inhibition of translation of respective one or more VGAM2595 host target proteins.

[87622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2595 gene, herein designated VGAM GENE, on one or more VGAM2595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87623] It is yet further appreciated that a function of VGAM2595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of viral infection by Apple Latent Spherical Virus. Specific functions, and accordingly utilities, of VGAM2595 correlate with, and may be deduced from, the identity of the host target genes which VGAM2595 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87624] Nucleotide sequences of the VGAM2595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2595 are further described hereinbelow with reference to Table 1.

[87625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2595 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87626] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2595 gene, herein designated VGAM is inhibition of expression of VGAM2595 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2595 correlate with, and may be deduced from, the identity of the target genes which VGAM2595 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87627] Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757) is a VGAM2595 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16495, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87628] A function of VGAM2595 is therefore inhibition of Master-

mind-like 1 (Drosophila) (MAML1, Accession NM_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM556.AWP1 (Accession NM_019006) is another VGAM2595 host target gene. AWP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AWP1 BINDING SITE, designated SEQ ID:21079, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87629] Another function of VGAM2595 is therefore inhibition of AWP1 (Accession NM_019006). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AWP1. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession

NM_004536) is another VGAM2595 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10883, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87630] Another function of VGAM2595 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM_004536). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. FLJ10159 (Accession NM_018013) is another VGAM2595 host target gene. FLJ10159 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10159 BINDING SITE, designated SEQ ID:19749, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ

ID:5306.

[87631] Another function of VGAM2595 is therefore inhibition of FLJ10159 (Accession NM_018013). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10159. KIAA0419 (Accession NM_014711) is another VGAM2595 host target gene. KIAA0419 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0419 BINDING SITE, designated SEQ ID:16260, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87632] Another function of VGAM2595 is therefore inhibition of KIAA0419 (Accession NM_014711). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0419. KIAA0970 (Accession NM_014923) is another VGAM2595 host target gene. KIAA0970 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0970, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0970 BINDING SITE, designated SEQ ID:17205, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87633] Another function of VGAM2595 is therefore inhibition of KIAA0970 (Accession NM_014923). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0970. KIAA1546 (Accession XM_042301) is another VGAM2595 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33716, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87634] Another function of VGAM2595 is therefore inhibition of KIAA1546 (Accession XM_042301). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1546. KIAA1673 (Accession XM_047672) is another VGAM2595 host target gene. KIAA1673 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1673 BINDING SITE, designated SEQ ID:35025, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87635] Another function of VGAM2595 is therefore inhibition of KIAA1673 (Accession XM_047672). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1673. TRAD (Accession NM_007064) is another VGAM2595 host target gene. TRAD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAD BINDING SITE, designated SEQ ID:13929, to the nucleotide sequence of

VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87636] Another function of VGAM2595 is therefore inhibition of TRAD (Accession NM_007064). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAD. LOC158381 (Accession XM_048461) is another VGAM2595 host target gene. LOC158381 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158381 BINDING SITE, designated SEQ ID:35175, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87637] Another function of VGAM2595 is therefore inhibition of LOC158381 (Accession XM_048461). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158381. LOC196283 (Accession XM_113684) is another VGAM2595 host target gene. LOC196283 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC196283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196283 BINDING SITE, designated SEQ ID:42342, to the nucleotide sequence of VGAM2595 RNA, herein designated VGAM RNA, also designated SEQ ID:5306.

[87638] Another function of VGAM2595 is therefore inhibition of LOC196283 (Accession XM_113684). Accordingly, utilities of VGAM2595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2596 (VGAM2596) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87639] VGAM2596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2596 was detected is described hereinabove with reference to Figs. 1-8.

[87640] VGAM2596 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tobacco Rattle Virus. VGAM2596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87641] VGAM2596 gene encodes a VGAM2596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2596 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2596 precursor RNA is designated SEQ ID:2582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2582 is located at position 3368 relative to the genome of Tobacco Rattle Virus.

[87642] VGAM2596 precursor RNA folds onto itself, forming VGAM2596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87643] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2596 folded precursor RNA into VGAM2596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2596 RNA is designated SEQ ID:5307, and is provided hereinbelow with reference to the sequence listing part.

[87644] VGAM2596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2596 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87645] VGAM2596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2596 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2596 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87646] The complementary binding of VGAM2596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2596

host target RNA into VGAM2596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87647] It is appreciated that VGAM2596 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2596 host target genes. The mRNA of each one of this plurality of VGAM2596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2596 RNA, herein designated VGAM RNA, and which when bound by VGAM2596 RNA causes inhibition of translation of respective one or more VGAM2596 host target proteins.

[87648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2596 gene, herein designated VGAM GENE, on one or more VGAM2596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87649] It is yet further appreciated that a function of VGAM2596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of viral infection by Tobacco Rattle Virus. Specific functions, and accordingly utilities, of VGAM2596 correlate with, and may be deduced from, the identity of the host target genes which VGAM2596 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87650] Nucleotide sequences of the VGAM2596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2596 are further described hereinbelow with reference to Table 1.

[87651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2596 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87652] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2596 gene, herein designated VGAM is inhibition of expression of VGAM2596 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2596 correlate with, and may be deduced from, the identity of the target genes which VGAM2596 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87653] Cysteine-rich Motor Neuron 1 (CRIM1, Accession

NM_016441) is a VGAM2596 host target gene. CRIM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIM1 BINDING SITE, designated SEQ ID:18559, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87654] A function of VGAM2596 is therefore inhibition of Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIM1. Deafness, Autosomal Dominant 5 (DFNA5, Accession NM_004403) is another VGAM2596 host target gene. DFNA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFNA5 BINDING SITE, designated SEQ ID:10656, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA,

also designated SEQ ID:5307.

[87655] Another function of VGAM2596 is therefore inhibition of Deafness, Autosomal Dominant 5 (DFNA5, Accession NM_004403). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFNA5. G Protein-coupled Receptor 4 (GPR4, Accession XM_009140) is another VGAM2596 host target gene. GPR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR4 BINDING SITE, designated SEQ ID:30101, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87656] Another function of VGAM2596 is therefore inhibition of G Protein-coupled Receptor 4 (GPR4, Accession XM_009140), a gene which stimulates to produce increased calcium by both SPC and LPC . Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR4. The function of GPR4 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2087.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM2596 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:12956, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87657] Another function of VGAM2596 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM1078.1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_032741) is another VGAM2596 host target gene. AGPAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AGPAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:26474, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87658] Another function of VGAM2596 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_032741). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AG-PAT1. Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095) is another VGAM2596 host target gene. AP3M1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by AP3M1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M1 BINDING SITE, designated SEQ ID:14398, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87659] Another function of VGAM2596 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 1 Subunit (AP3M1, Accession NM_012095). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M1. Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586) is another VGAM2596 host target gene. C9orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf7 BINDING SITE, designated SEQ ID:19036, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87660] Another function of VGAM2596 is therefore inhibition of Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf7. DKFZP434F0318 (Accession NM_030817) is another VGAM2596 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25146, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87661] Another function of VGAM2596 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. DKFZP434H132 (Accession XM_057020) is another VGAM2596 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36443, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87662] Another function of VGAM2596 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZP566K1924 (Accession XM_057469) is another VGAM2596 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36522, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87663] Another function of VGAM2596 is therefore inhibition of

DKFZP566K1924 (Accession XM_057469). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. HSU79252 (Accession NM_013298) is another VGAM2596 host target gene. HSU79252 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSU79252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU79252 BINDING SITE, designated SEQ ID:14958, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87664] Another function of VGAM2596 is therefore inhibition of HSU79252 (Accession NM_013298). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79252. KIAA0064 (Accession NM_014748) is another VGAM2596 host target gene. KIAA0064 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0064 BINDING SITE, designated SEQ ID:16460, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87665] Another function of VGAM2596 is therefore inhibition of KIAA0064 (Accession NM_014748). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0064. KIAA0410 (Accession NM_014778) is another VGAM2596 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16623, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87666] Another function of VGAM2596 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. KIAA1710 (Accession XM_031283) is another

VGAM2596 host target gene. KIAA1710 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1710 BINDING SITE, designated SEQ ID:31331, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87667] Another function of VGAM2596 is therefore inhibition of KIAA1710 (Accession XM_031283). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1710. KIAA1853 (Accession XM_045184) is another VGAM2596 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34390, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87668] Another function of VGAM2596 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. MGC5338 (Accession NM_024062) is another VGAM2596 host target gene. MGC5338 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5338 BINDING SITE, designated SEQ ID:23498, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87669] Another function of VGAM2596 is therefore inhibition of MGC5338 (Accession NM_024062). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5338. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550) is another VGAM2596 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17819, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87670] Another function of VGAM2596 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. P37NB (Accession NM_005824) is another VGAM2596 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:12436, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87671] Another function of VGAM2596 is therefore inhibition of P37NB (Accession NM_005824). Accordingly, utilities of

VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. Protocadherin 19 (PCDH19, Accession XM_033173) is another VGAM2596 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31865, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87672] Another function of VGAM2596 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM_033173). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. PI4KII (Accession NM_018425) is another VGAM2596 host target gene. PI4KII BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PI4KII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI4KII BIND-

ING SITE, designated SEQ ID:20482, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87673] Another function of VGAM2596 is therefore inhibition of PI4KII (Accession NM_018425). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI4KII. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM2596 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16400, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87674] Another function of VGAM2596 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

RASSF2. LOC115286 (Accession XM_055644) is another VGAM2596 host target gene. LOC115286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115286 BINDING SITE, designated SEQ ID:36314, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87675] Another function of VGAM2596 is therefore inhibition of LOC115286 (Accession XM_055644). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115286. LOC152195 (Accession XM_098172) is another VGAM2596 host target gene. LOC152195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152195 BINDING SITE, designated SEQ ID:41433, to the nucleotide sequence of VGAM2596 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5307.

[87676] Another function of VGAM2596 is therefore inhibition of LOC152195 (Accession XM_098172). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152195. LOC54516 (Accession NM_019041) is another VGAM2596 host target gene. LOC54516 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC54516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54516 BINDING SITE, designated SEQ ID:21124, to the nucleotide sequence of VGAM2596 RNA, herein designated VGAM RNA, also designated SEQ ID:5307.

[87677] Another function of VGAM2596 is therefore inhibition of LOC54516 (Accession NM_019041). Accordingly, utilities of VGAM2596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54516. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2597 (VGAM2597) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87678] VGAM2597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2597 was detected is described hereinabove with reference to Figs. 1-8.

[87679] VGAM2597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Rattle Virus. VGAM2597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87680] VGAM2597 gene encodes a VGAM2597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2597 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2597 precursor RNA is designated SEQ ID:2583, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2583 is located at position 1854 relative to the genome of Tobacco Rattle Virus.

[87681] VGAM2597 precursor RNA folds onto itself, forming

VGAM2597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2597 folded precursor RNA into VGAM2597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2597 RNA is designated SEQ ID:5308, and is provided hereinbelow with reference to the sequence listing part.

[87683] VGAM2597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2597 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87684] VGAM2597 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2597 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87685] The complementary binding of VGAM2597 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2597 host target RNA into VGAM2597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87686] It is appreciated that VGAM2597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2597 host target genes. The mRNA of each one of this plurality of VGAM2597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2597 RNA, herein designated VGAM RNA, and which when bound by VGAM2597 RNA causes inhibition of translation of respective one or more VGAM2597 host target proteins.

[87687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2597 gene, herein designated VGAM GENE, on one or more VGAM2597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87688] It is yet further appreciated that a function of VGAM2597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2597 include diagnosis, prevention and treatment of viral infection by Tobacco Rattle Virus. Specific functions, and accordingly utilities, of VGAM2597 correlate with, and may be deduced from, the identity of the host target genes which VGAM2597 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[87689] Nucleotide sequences of the VGAM2597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2597 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2597 are further described hereinbelow with reference to Table 1.

[87690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2597 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2597 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2597 gene, herein designated VGAM is inhibition of expression of VGAM2597 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2597 correlate with, and may be deduced from, the identity of the target genes which VGAM2597 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[87692] Toll-like Receptor 1 (TLR1, Accession NM_003263) is a VGAM2597 host target gene. TLR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLR1 BINDING SITE, designated SEQ ID:9275, to the nucleotide sequence of VGAM2597 RNA, herein designated VGAM RNA, also designated SEQ ID:5308.

[87693] A function of VGAM2597 is therefore inhibition of Toll-like Receptor 1 (TLR1, Accession NM_003263), a gene which is a critical for antibody responses to OspA. Accordingly, utilities of VGAM2597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR1. The function of TLR1 has been established by previous studies. TLRs and IL1Rs share a conserved cytoplasmic TIR domain. Mutations in this domain disrupt responses to LPS and to gram-positive bacteria, mediated by TLR4 and TLR2 (OMIM Ref. No. 603028), respectively. By structural analysis, Xu et al. (2000) determined that the TIR domains of human TLR2

and TLR1, which are 50% identical at the amino acid level, contain a central 5-stranded parallel beta-sheet surrounded by 5 alpha helices on both sides. The structures have a large conserved surface patch, and mutational and functional analyses indicated that residues in the surface patch are crucial for receptor signaling. The authors concluded that instead of disturbing the structure of the TIR domain, mutations may abolish signaling by disrupting the recruitment of the MYD88 (OMIM Ref. No. 602170) adaptor molecule. Alexopoulou et al. (2002) reported that a small percentage of individuals who receive a vaccination series with the OspA antigen of Borrelia burgdorferi, the causative spirochete agent of Lyme disease, have very low antibody responses to the vaccine. They studied 7 of these 'low responders.' Macrophages from the low responders produced lower levels of the proinflammatory cytokines tumor necrosis factor (TNF; 191160) and IL6 (OMIM Ref. No. 147620), while production of the antiinflammatory cytokine IL10 (OMIM Ref. No. 124092) was similar to that of normal responders. Mutation analysis did not identify any defects in the TLR2 gene in the low responders. The human low antibody responders had no mutations in the TLR1 gene. However, flow cytometric

analysis demonstrated undetectable cell-surface expression of TLR1, but not of TLR2, in all but 1 of the low responders. Animal model experiments lend further support to the function of TLR1. Tlr2-deficient mice produced lower levels of antibody and IL6 in response to OspA in the absence of complete Freund adjuvant (CFA), but not to intact B. burgdorferi. Apart from a higher spirochete burden early in the course of the disease, Tlr2 -/- mice resolved the infection in a manner similar to wildtype mice. Tlr1-deficient mice had a similar pattern of responses, except that these mice were capable of producing IL6 in response to peptidoglycan and were also capable of making IL10 in response to OspA. Alexopoulou et al. (2002) concluded that although TLR1 expression is critical for antibody responses to OspA, the presence of other TLRs in the host that presumably recognize other B. burgdorferi antigens results in no greater susceptibility to infection and disease in these hosts.

[87694] It is appreciated that the abovementioned animal model for TLR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[87695] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[87696] Xu, Y.; Tao, X.; Shen, B.; Horng, T.; Medzhitov, R.; Manley, J. L.; Tong, L. : Structural basis for signal transduction by the Toll/interleukin-1 receptor domains. Nature 408: 111-115, 2000. ; and

[87697] Alexopoulou, L.; Thomas, V.; Schnare, M.; Lobet, Y.; Anguita, J.; Schoen, R. T.; Medzhitov, R.; Fikrig, E.; Flavell, R. A. : Hyporesponsiveness to vaccination with Borrelia burgdorferi.

[87698] Further studies establishing the function and utilities of TLR1 are found in John Hopkins OMIM database record ID 601194, and in sited publications numbered 9835-9836, 6736, 983 and 10819-9840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ14440 (Accession NM_032784) is another VGAM2597 host target gene. FLJ14440 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14440 BINDING SITE, designated SEQ ID:26529, to the nucleotide

sequence of VGAM2597 RNA, herein designated VGAM RNA, also designated SEQ ID:5308.

[87699] Another function of VGAM2597 is therefore inhibition of FLJ14440 (Accession NM_032784). Accordingly, utilities of VGAM2597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14440. P450RAI-2 (Accession NM_019885) is another VGAM2597 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21265, to the nucleotide sequence of VGAM2597 RNA, herein designated VGAM RNA, also designated SEQ ID:5308.

[87700] Another function of VGAM2597 is therefore inhibition of P450RAI-2 (Accession NM_019885). Accordingly, utilities of VGAM2597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. LOC200347 (Accession XM_114219) is another VGAM2597 host target gene. LOC200347 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC200347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200347 BINDING SITE, designated SEQ ID:42806, to the nucleotide sequence of VGAM2597 RNA, herein designated VGAM RNA, also designated SEQ ID:5308.

[87701] Another function of VGAM2597 is therefore inhibition of LOC200347 (Accession XM_114219). Accordingly, utilities of VGAM2597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200347. LOC51716 (Accession NM_016280) is another VGAM2597 host target gene. LOC51716 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51716 BINDING SITE, designated SEQ ID:18404, to the nucleotide sequence of VGAM2597 RNA, herein designated VGAM RNA, also designated SEQ ID:5308.

[87702] Another function of VGAM2597 is therefore inhibition of LOC51716 (Accession NM_016280). Accordingly, utilities

of VGAM2597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51716. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2598 (VGAM2598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87703] VGAM2598 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2598 was detected is described hereinabove with reference to Figs. 1-8.

[87704] VGAM2598 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Rattle Virus. VGAM2598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[87705] VGAM2598 gene encodes a VGAM2598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2598 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2598 precursor RNA is designated SEQ ID:2584, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2584 is located at position 1327 relative to the genome of Tobacco Rattle Virus.

[87706] VGAM2598 precursor RNA folds onto itself, forming VGAM2598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[87707] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2598 folded precursor RNA into VGAM2598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2598 RNA is designated SEQ ID:5309, and

is provided hereinbelow with reference to the sequence listing part.

[87708] VGAM2598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2598 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[87709] VGAM2598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2598 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2598 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[87710] The complementary binding of VGAM2598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2598 host target RNA into VGAM2598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[87711] It is appreciated that VGAM2598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2598 host target genes. The mRNA of each one of this plurality of VGAM2598 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2598 RNA, herein designated VGAM RNA, and which when bound by VGAM2598 RNA causes inhibition of translation of respective one or more VGAM2598 host target proteins.

[87712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2598 gene, herein designated VGAM GENE, on one or more VGAM2598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[87713] It is yet further appreciated that a function of VGAM2598 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2598 include diagnosis, prevention and treatment of viral infection by Tobacco Rattle Virus. Specific functions, and accordingly utilities, of VGAM2598 correlate with, and may be deduced from, the identity of the host target genes which VGAM2598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[87714] Nucleotide sequences of the VGAM2598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2598 are further described hereinbelow with reference to Table 1.

[87715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2598 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[87716] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2598 gene, herein designated VGAM is inhibition of expression of VGAM2598 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2598 correlate with, and may be deduced from, the identity of the target genes which VGAM2598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[87717] Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462) is a VGAM2598 host target gene. FPRL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FPRL1 BINDING SITE, designated SEQ ID:7196, to the nucleotide sequence of VGAM2598 RNA, herein designated VGAM RNA, also designated SEQ ID:5309.

[87718] A function of VGAM2598 is therefore inhibition of Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462). Accordingly, utilities of VGAM2598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPRL1. Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182) is another

VGAM2598 host target gene. IL1RAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1RAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAP BINDING SITE, designated SEQ ID:7939, to the nucleotide sequence of VGAM2598 RNA, herein designated VGAM RNA, also designated SEQ ID:5309.

[87719] Another function of VGAM2598 is therefore inhibition of Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182), a gene which may function as a membrane receptor. promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM2598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAP. The function of IL1RAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2599 (VGAM2599) viral gene, which modulates expression

of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[87720] VGAM2599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2599 was detected is described hereinabove with reference to Figs. 1-8.

[87721] VGAM2599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Obuda Pepper Virus. VGAM2599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
